## Lab 5: Ciphers and Crypto Fundamentals

Bill, Richard, Charley

## Aim:

The aim of this lab is to give an introduction to ciphers, basic encoding/decoding techniques and frequency analysis, as to provide some fundamental understanding. Activities include decoding a range of ciphers and simple calculations.

## Time to Complete:

4 hours (two supervised hours in the lab, and two additional unsupervised hours).

## Learning activities:

At the end of this lab, you should understand:

- How to decode a range of ciphers.
- How to recognise certain encodings, such as Base-64, hex, and binary.
- How to write a Python script to crack PFX certificates. The PKCS\#12 (PFX or P12) format is the binary format in which certificates are stored on a server. They are protected by a password and contain the public and private key (the key pair).
- How to perform bitwise calculations.
- How to perform frequency analysis.

## Reflective statements (end-of-exercise):

- What do you think will happen when you do a frequency analysis of the bytes in an encrypted or compressed file?
- If we use a password to protect our key pairs on the server, what is the main weakness of this?

## Lab 5: Ciphers and Crypto Fundamentals

Use your desktop computer to complete the following:

## A Introduction

| No | Description | Result |
| :---: | :---: | :---: |
| 1 | Go to: <br> http://asecuritysite.com/Challenges <br> Click on the "Start Challenge" button, and see if you can score over 30 points. | Your score: |
| 2 | Using: http://asecuritysite.com/Encryption/testprime <br> Test for the following prime numbers: | $\begin{aligned} & \text { 91: [Yes] [No] } \\ & \text { 421: [Yes] [No] } \\ & \text { 1449: [Yes] [No] } \end{aligned}$ |
| 3 | Using: http://asecuritysite.com/Encryption/gcd <br> Determine the GCD for the following: | $\begin{aligned} & 88,46: \\ & 105,35: \end{aligned}$ |
| 4 | Using: http://asecuritysite.com/coding/ascii <br> Determine the Base 64 and Hex values for the following strings: | Hello: <br> hello: <br> HELLO: |
| 5 | Using: http://asecuritysite.com/coding/ascii <br> Determine the following ASCII strings for these encoded formats: | bGxveWRz <br> 6E6170696572 <br> 010000010110111001101011 011011000110010100110001 0011001000110011 |
| 6 | Using: http://asecuritysite.com/Coding/exor <br> Determine the EX-OR of "hello" ex-ORed with the letter ' $t$ ' | Hex: <br> Base 64: <br> Is the result printable in ASCII? [Yes][No] |

| $\mathbf{7}$ | What is the result of $53,431 \bmod 453 ?$ |  |
| :--- | :--- | :--- |
| $\mathbf{8}$ | Generate a random number from: <br> http://asecuritysite.com/Encryption/j | How many hex characters <br> does the result have? |
| $\mathbf{9}$ | Try and crack some certificates from: <br> http://asecuritysite.com/Encryption/certcrack <br> What are the passwords for 'bill09.pfx', <br> 'bill18.pfx', and 'country04.pfx'? | bill09.pfx: <br> bill18.pfx: <br> country04.pfx: |

10. We can also create a short Python script to try to crack the same certificates.

Boot up your Kali VM, and download the following archive:
http://asecuritysite.com/public/certs.zip
Extract the certificates into the/root folder, and then move into that folder. Now use openssl to try a password:

```
openss1 pkcs12 -nokeys -in bil101.pfx -passin pass:orange
```

Did you manage to run the script?
What password is correct for bill01.pfx?

Now implement the Python script in Program 1.

```
from OpenssL import crypto
words=[]
words.append("coconut")
words.append("mango")
words.append("apples")
words.append("apple")
words.append("oranges")
words.append("orange")
words.append("ankle")
words.append("password")
words.append("bil1")
words.append("battery")
for passwd in words:
    try:
        p12 = crypto.load_pkcs12(open("fredpfx.pfx", 'rb').read(), passwd)
        certificate =p12.get_certificate()
        p12.get_privatekey()
        print certificate.get_serial_number()
        print certificate.get_issuer().get_components()
        print certificate.get_signature_algorithm()
        print ("Success: "+passwd)
    except Exception as ex:
        print (".")
```

Can adapt this script to crack some of the other certificates contained in the archive you have downloaded. Bill01.pdf to bill18.pdf are based on fruits (in lowercase), country01.pdf to country06.pdf are based on countries.

Outline the passwords of the certificates:

Can you modify the code so that it shows other details from the certificate, such as its public key, subject, version and "notBefore", and "notAfter".

Ref: https://pyopenssl.org/en/0.15.1/api/crypto.html\#x509name-objects

## B Frequency Analysis

Now see if you can crack the five minute cracking challenge for:
http://asecuritysite.com/challenges/scramb

## C Character mapping

Complete the following table for each of the characters:

| Char | Decimal | Binary | Hex | Oct | HTML |
| :--- | :--- | :--- | :--- | :--- | :--- |
| (Space) |  |  |  |  |  |
| a |  |  |  |  |  |
| $\}$ |  |  |  |  |  |
| $\tilde{A}$ |  |  |  |  |  |
| $\ddot{y}$ |  |  |  |  |  |

## D Test

1. Crack some Caesar codes at: http://asecuritysite.com/tests/tests?sortBy=caesar
2. Determine some hex conversions at: http://asecuritysite.com/tests/tests?sortBy=hex01
3. Determine some Base64 conversions: http://asecuritysite.com/tests/tests?sortBy=ascii01

4 Now complete the test at: http://asecuritysite.com/tests/tests?sortBy=crypto01
