

Advanced Crypto

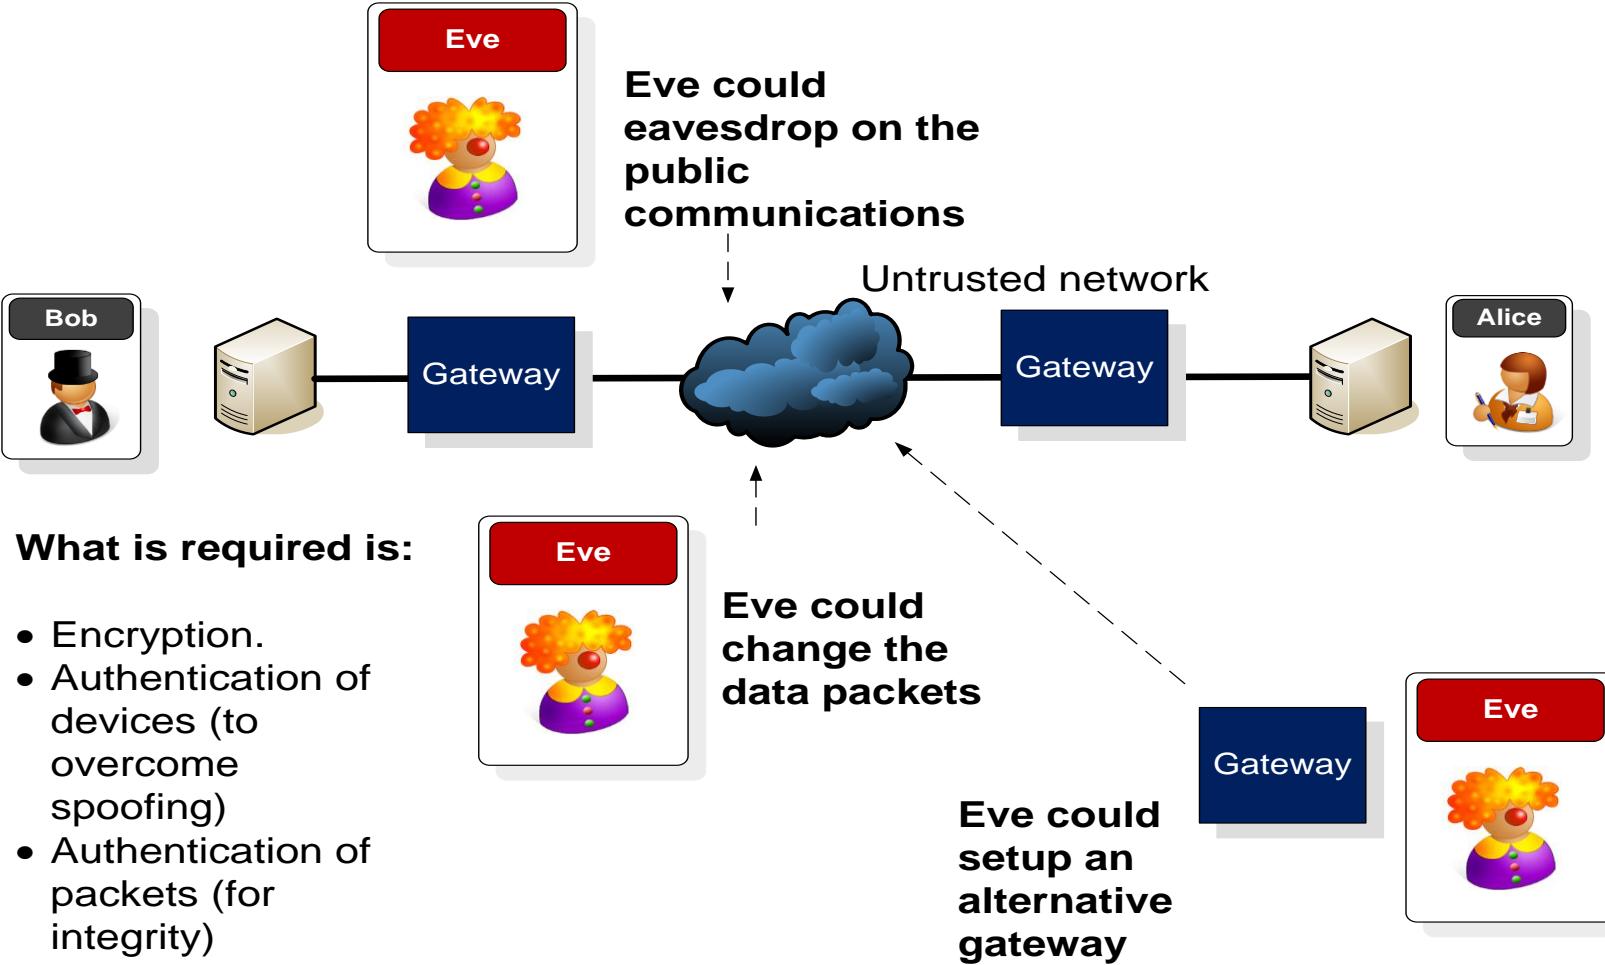

6. Tunnelling

Introduction

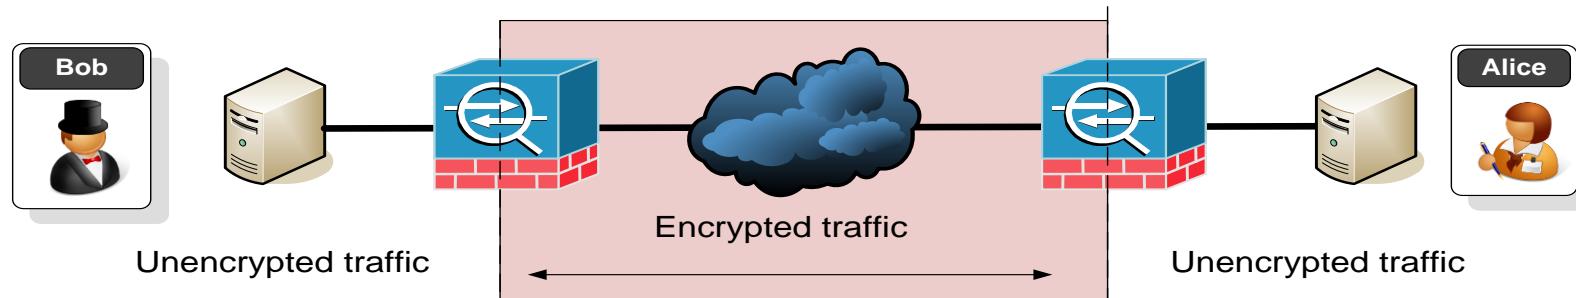

<http://asecuritysite.com/crypto>

Author: Prof Bill Buchanan

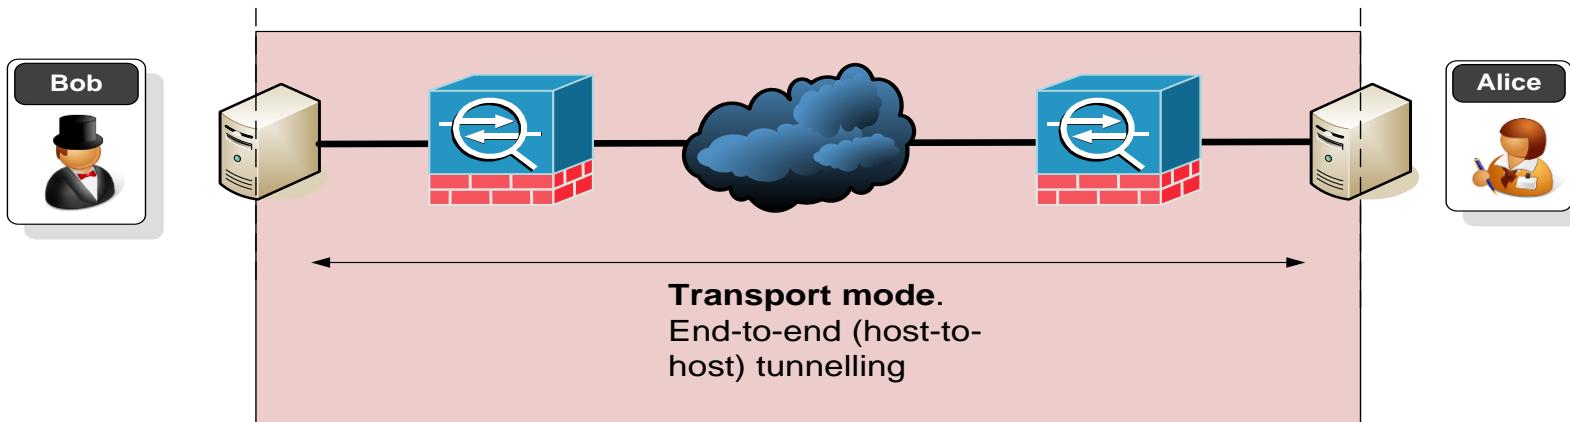

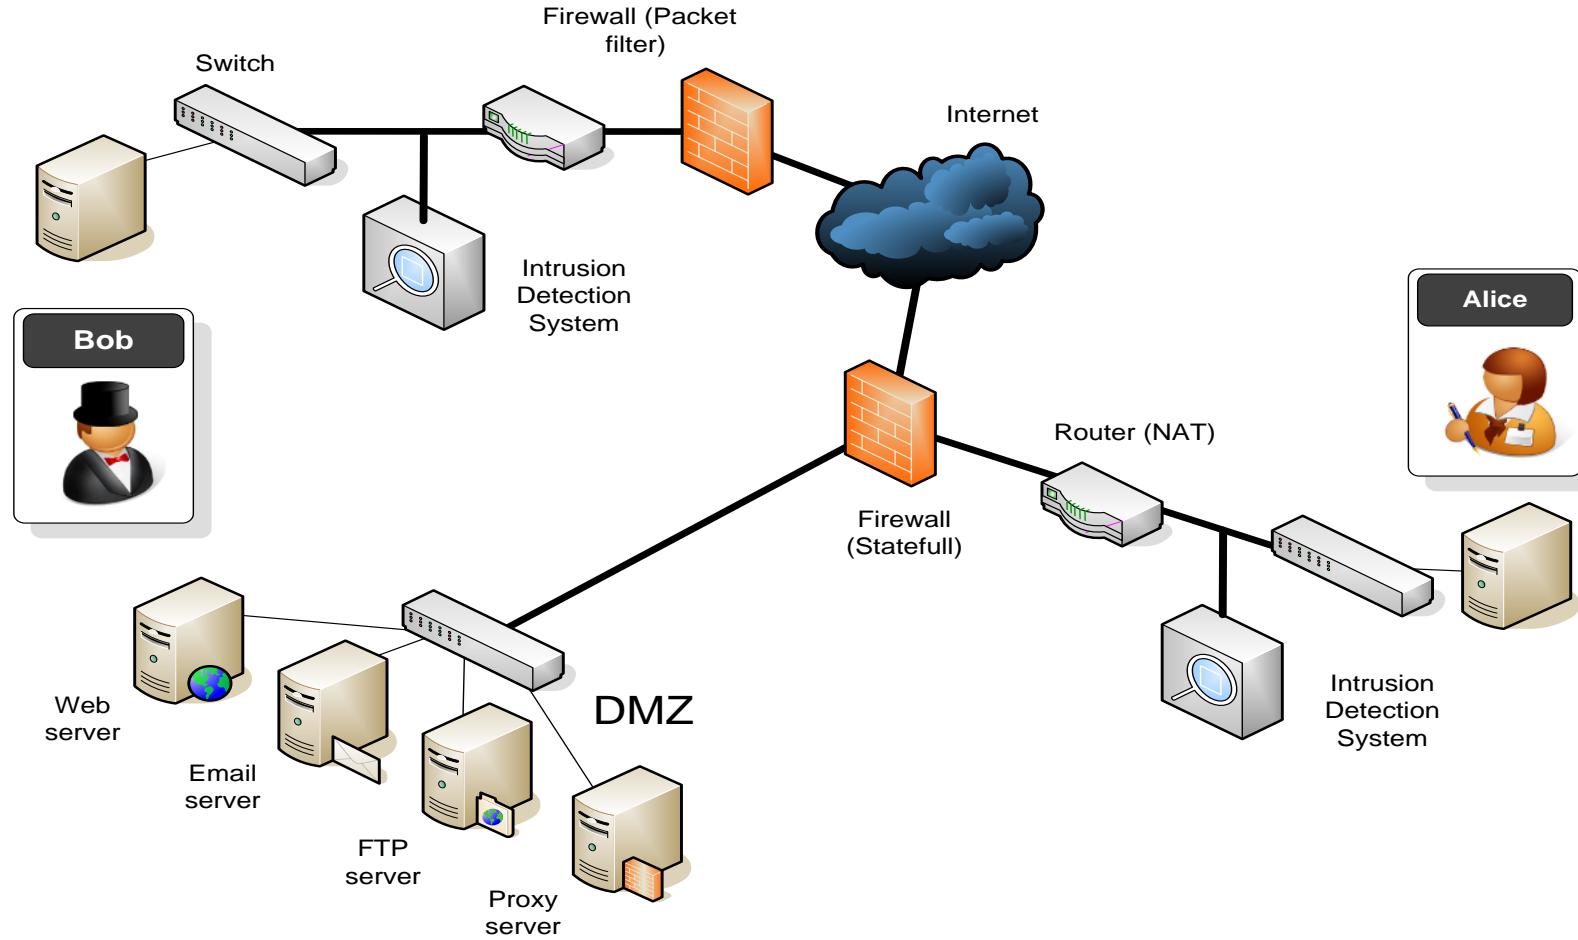

Traffic is encrypted over the untrusted network.

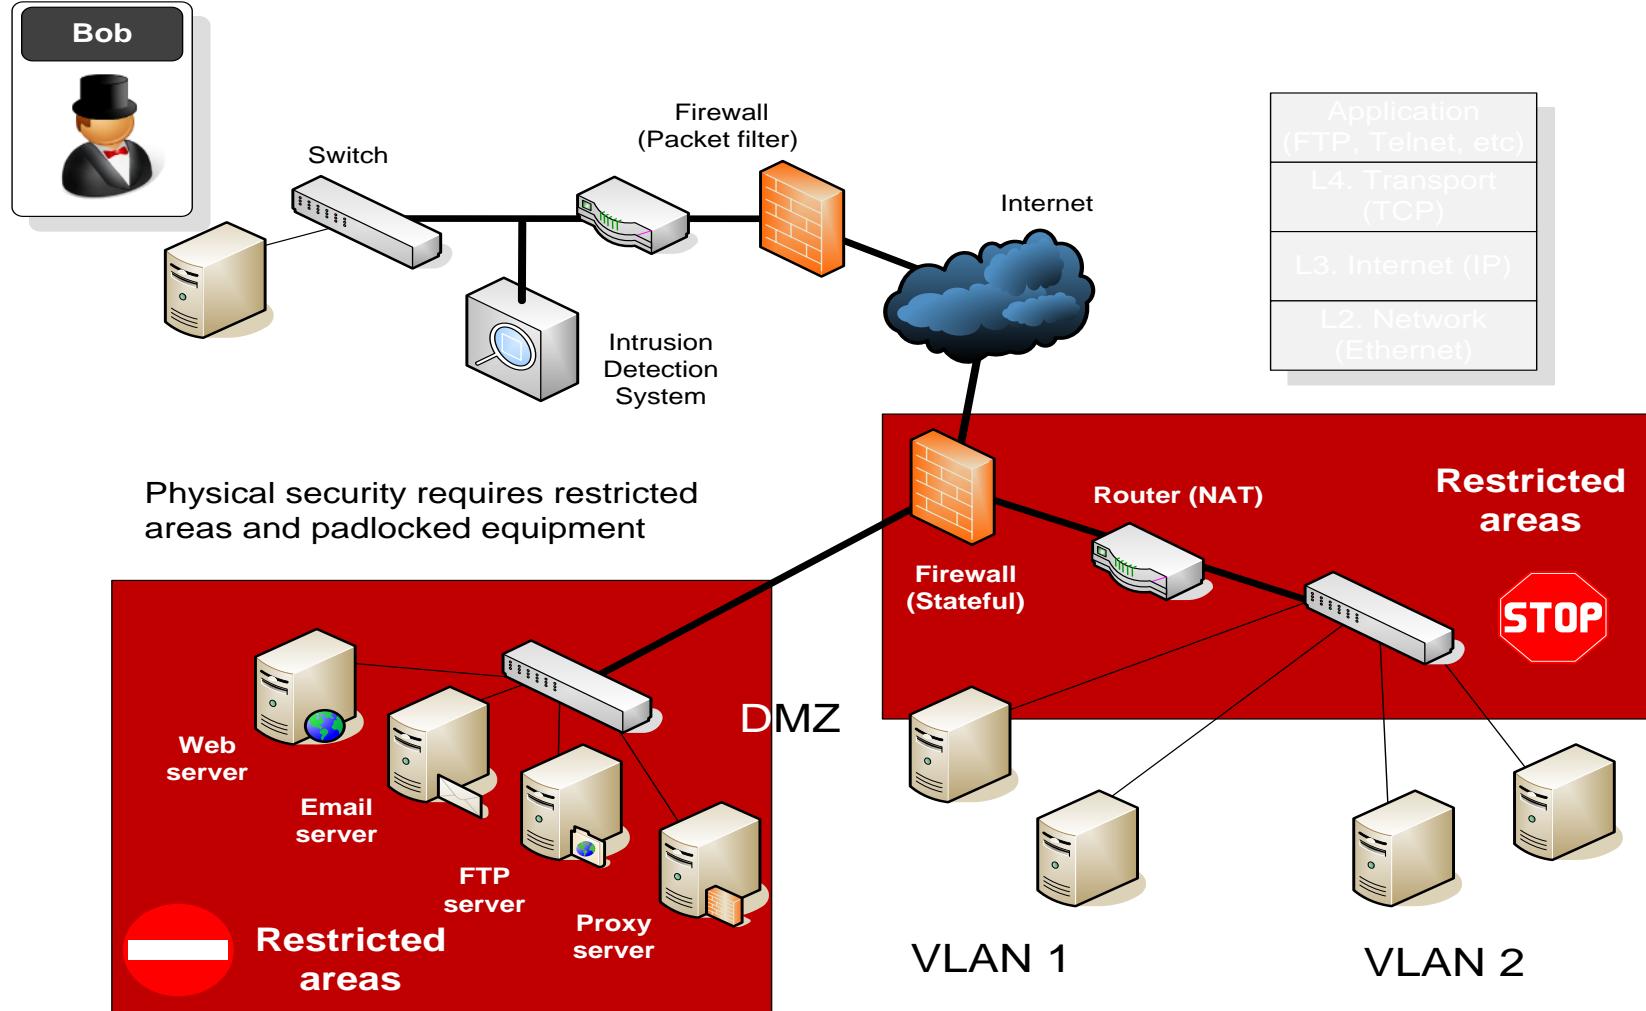

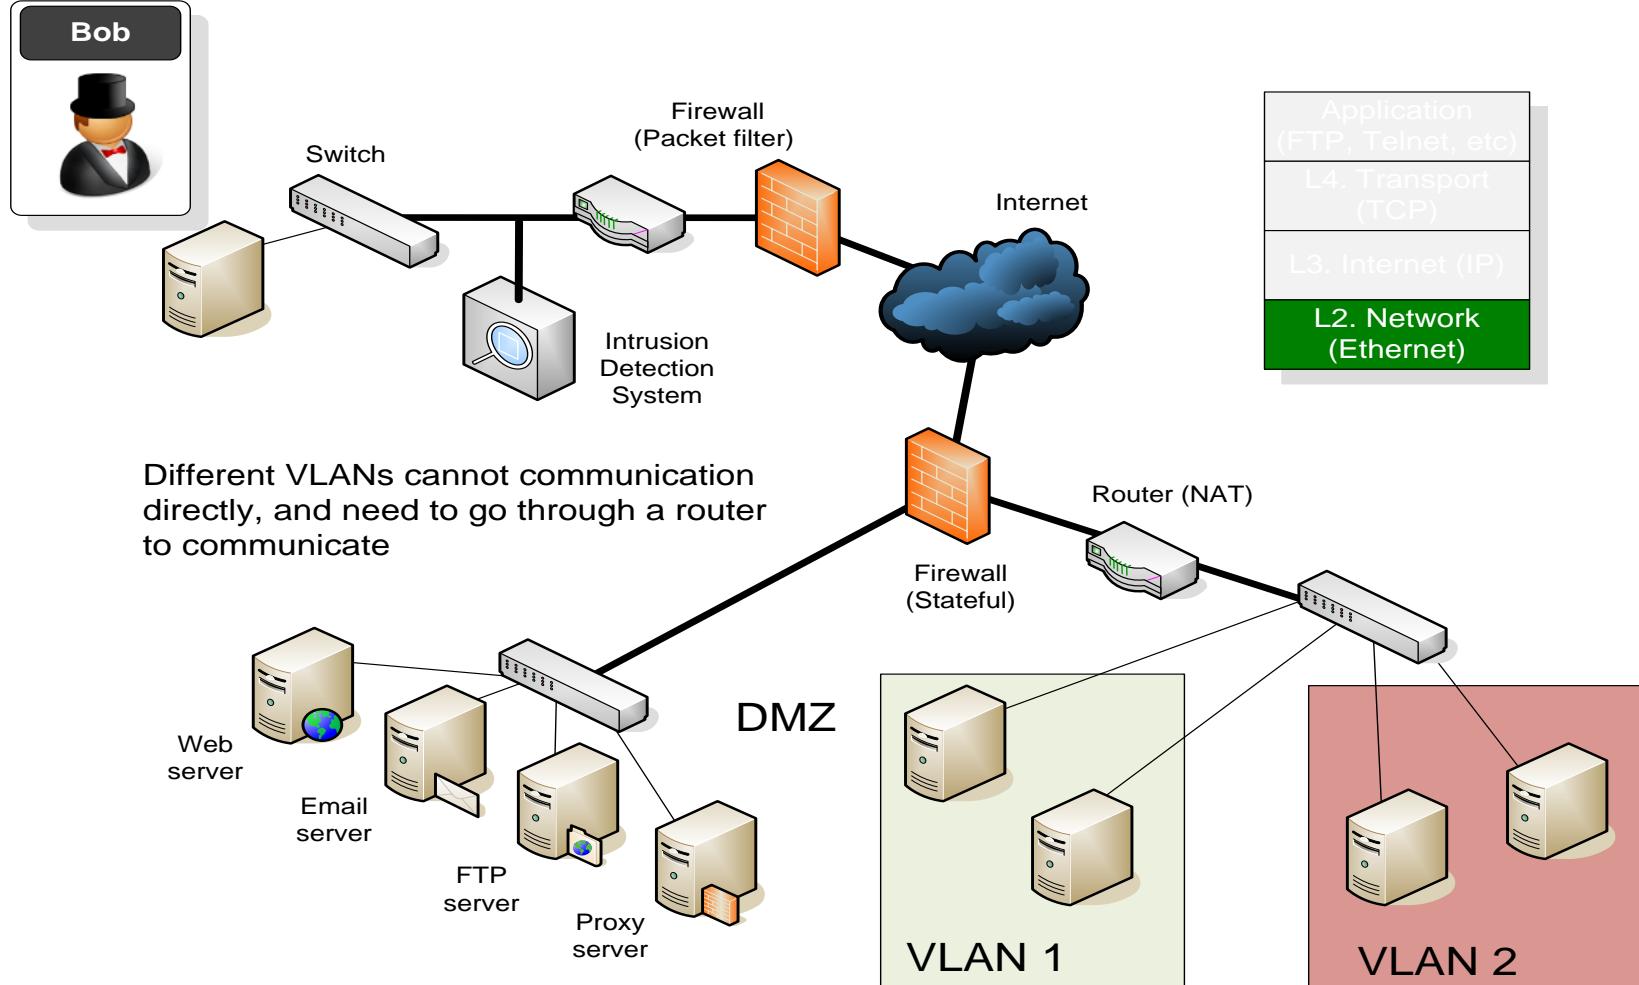

Tunelling mode (over untrusted connections)

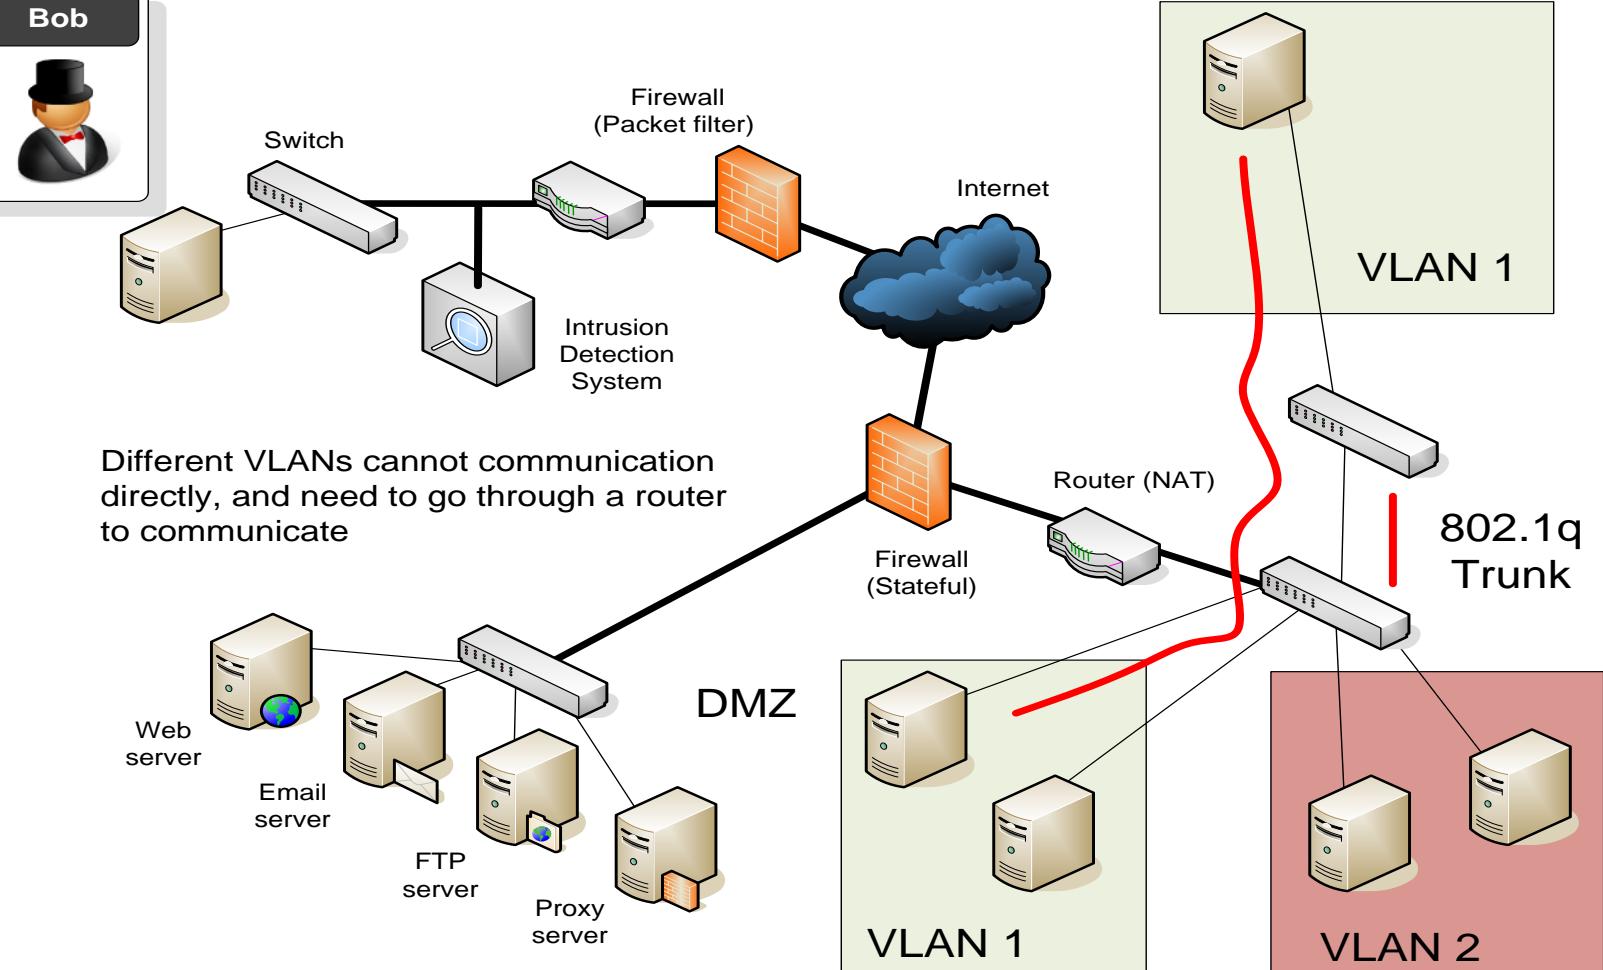

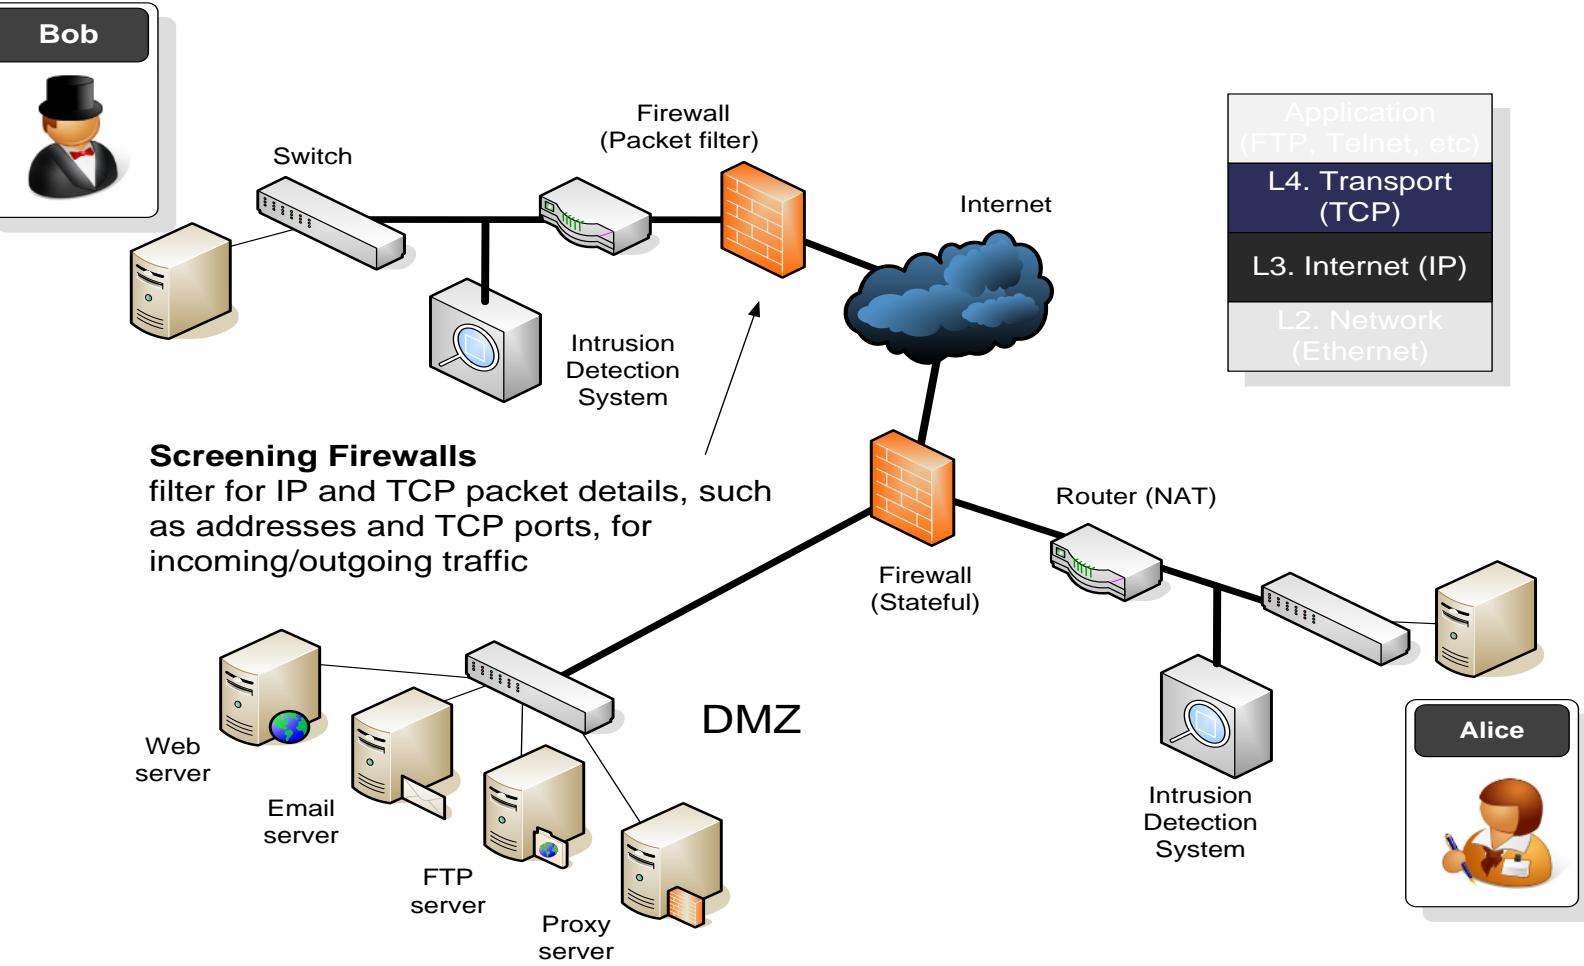

Transport mode.
End-to-end (host-to-host) tunnelling

Network Security

Stateful firewall

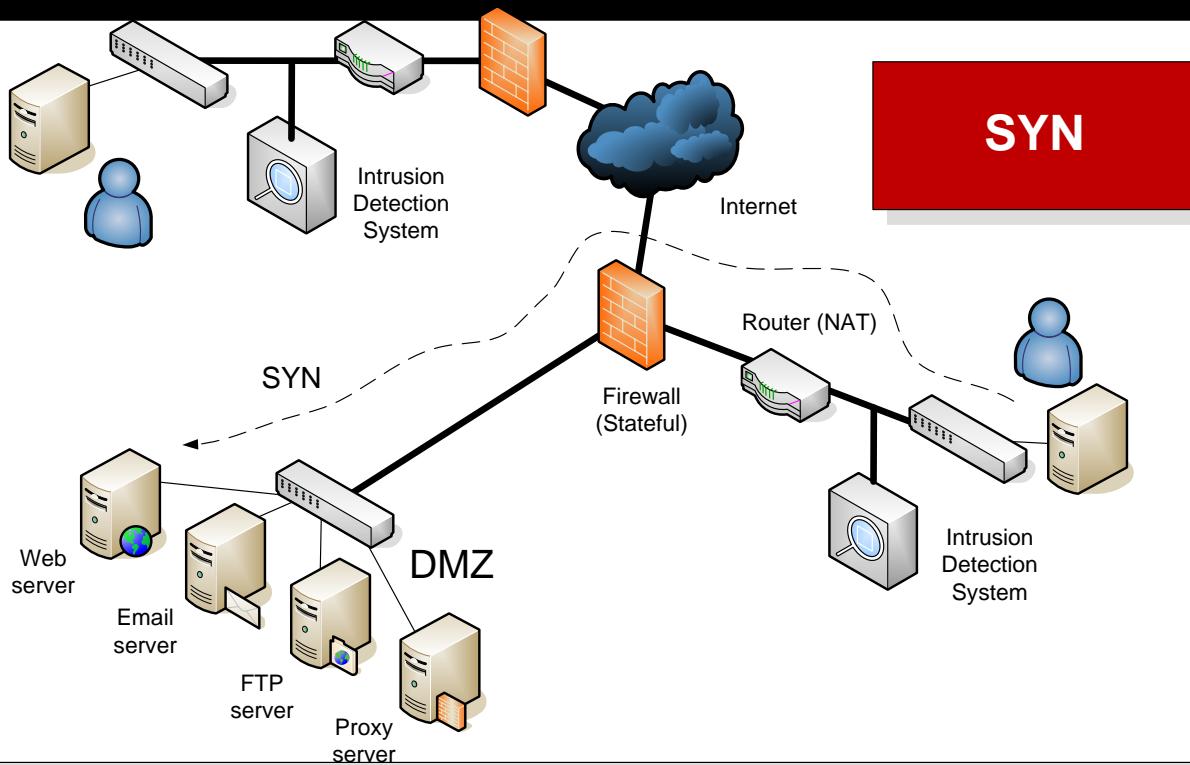

Originator

1. CLOSED
2. SYN-SENT <SEQ=999><CTL=SYN>
3. ESTABLISHED <SEQ=100><ACK=1000><CTL=SYN,ACK>
4. ESTABLISHED <SEQ=1000><ACK=101><CTL=ACK>
5. ESTABLISHED <SEQ=1000><ACK=101><CTL=ACK><DATA>

Recipient

Heartbleed

<http://asecuritysite.com/crypto>

Author: Prof Bill Buchanan

"On the scale of 1 to 10, this is an 11. Half a million sites are vulnerable, including my own."

Has anyone looked at all the low-margin non-upgradable embedded systems that use OpenSSL? An upgrade path that involves the trash, a visit to Best Buy, and a credit card isn't going to be fun for anyone.

... a 'catastrophic' revelation and suggested it could have been created deliberately to help snoop through firms' data.

I'm hearing that the CAs are completely clogged, trying to reissue so many new certificates. And I'm not sure we have anything close to the infrastructure necessary to revoke half a million certificates.

```
# cat /etc/shadow  
root:$1$Etg2ExUZ$F9NTP7omafhK1lqaBMqng1:15651:0:99999:7:::  
# openssl passwd -1 -salt Etg2ExUZ redhat  
$1$Etg2ExUZ$F9NTP7omafhK1lqaBMqng1
```

#else
/*
 * XXXX just disable all digests for now, because it sucks.
 * we need a better way to decide this - i.e. I may not
 * want digests on slow cards like hifn on fast machines,
 * but might want them on slow or loaded machines, etc.
 * will also want them when using crypto cards that don't
 * suck moose gonads - would be nice to be able to decide something
 * as reasonable default without having hackery that's card dependent.
 * of course, the default should probably be just do everything,
 * with perhaps a sysctl to turn algorithms off (or have them off
 * by default) on cards that generally suck like the hifn.

Transport Layer Security (TLS) and Datagram Transport Layer Security (DTLS) Heartbeat Extension

Abstract

This document describes the Heartbeat Extension for the Transport Layer Security (TLS) and Datagram Transport Layer Security (DTLS) protocols.

The Heartbeat Extension provides a new protocol for TLS/DTLS allowing the usage of keep-alive functionality without performing a renegotiation and a basis for path MTU (PMTU) discovery for DTLS.

```
struct {  
    HeartbeatMessageType type;           64KB max  
    uint16 payload_length;  
    opaque payload[HeartbeatMessage.payload_length];  
    opaque padding[padding_length];  
} HeartbeatMessage;  
  
payload: The payload consists of  
arbitrary content.

1 April (4pm). OpenSSL distributed to rest of the team.

2 April (9:30) Codenomicon discover bug

3 April Codenomicon tell National Cyber Security Centre Finland (NCSC-FI)

The Heartbleed Bug is a serious vulnerability in the popular OpenSSL cryptographic software library. This weakness allows stealing the information protected by SSL/TLS for communication security and privacy over the Internet for applications such as web, email, instant messaging (IM) and private virtual private networks (VPNs). The Heartbleed bug is being actively exploited on the Internet to steal the memory of the servers enabled to use vulnerable versions of the OpenSSL software. This compromises the secret keys used to identify the service providers and to encrypt the traffic, the names and passwords of the users and the actual content. This allows attackers to eavesdrop on communications, steal data directly from the services and users and impersonate services and users.

What leaks in practice?

We review the logs of our own services from

attackers perspective. The attack comes from outside, without leaving a trace. Without using any

privileged information or credentials we were able

to steal from ourselves the secret keys used for our

SSL/TLS, user names and passwords, instant

messages, emails and business critical documents and

communication.

How to stop the leak?

As long as the vulnerable version of OpenSSL is in use,

it can be exploited. From OpenSSL 1.0.2, it has been fixed

and now it has to be deployed. Operating system

vendors and distribution appliance vendors;

independent software vendors have to adopt the fix

and update their software. Software developers

have to install the fix as it becomes available for the

operating systems, networked appliances and software

they use.

Users are being encouraged to change their passwords on sites that have tackled the bug.

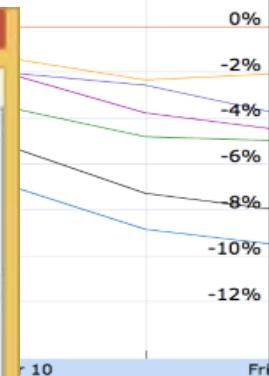

Several tech firms are urging people to change all their passwords after the discovery of a major security flaw.

Chartered Institute of Taxation (Ghana)
(ESTABLISHED IN 1980)
THE PROFESSIONAL BODY FOR TAX PROFESSIONALS

<http://www.taxghana.org>
List of Members in Good Standing at 2013

How much do you need for open source?

**Apache Software
Foundation
(\$905,732- 2013)**

**Linux Foundation
(\$6.25 million -
2014)**

**Mozilla Foundation
(\$311 million - 2012)**

OpenSSL? Marquess ... “A few million a year would do grandly. There should be half a dozen guys working full-time, plus support.”

24 April 2104

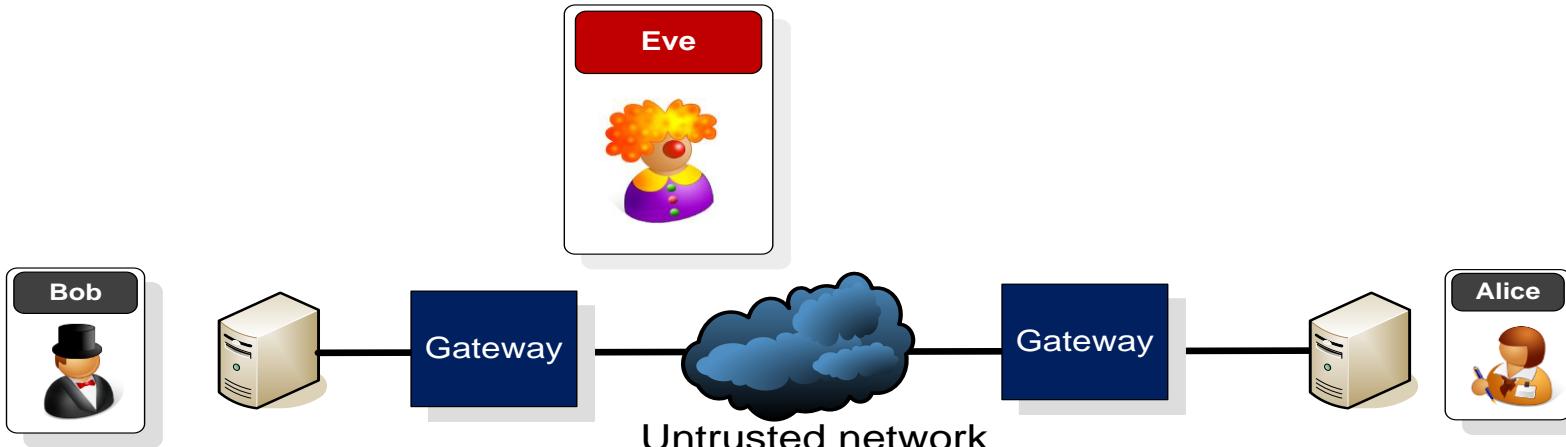

Linux Foundation defines Core Infrastructure Initiative, - multimillion-dollar project funding critical path - \$3.9 million for three years, ... Top of List ... OpenSSL.

Network Security

VPNs

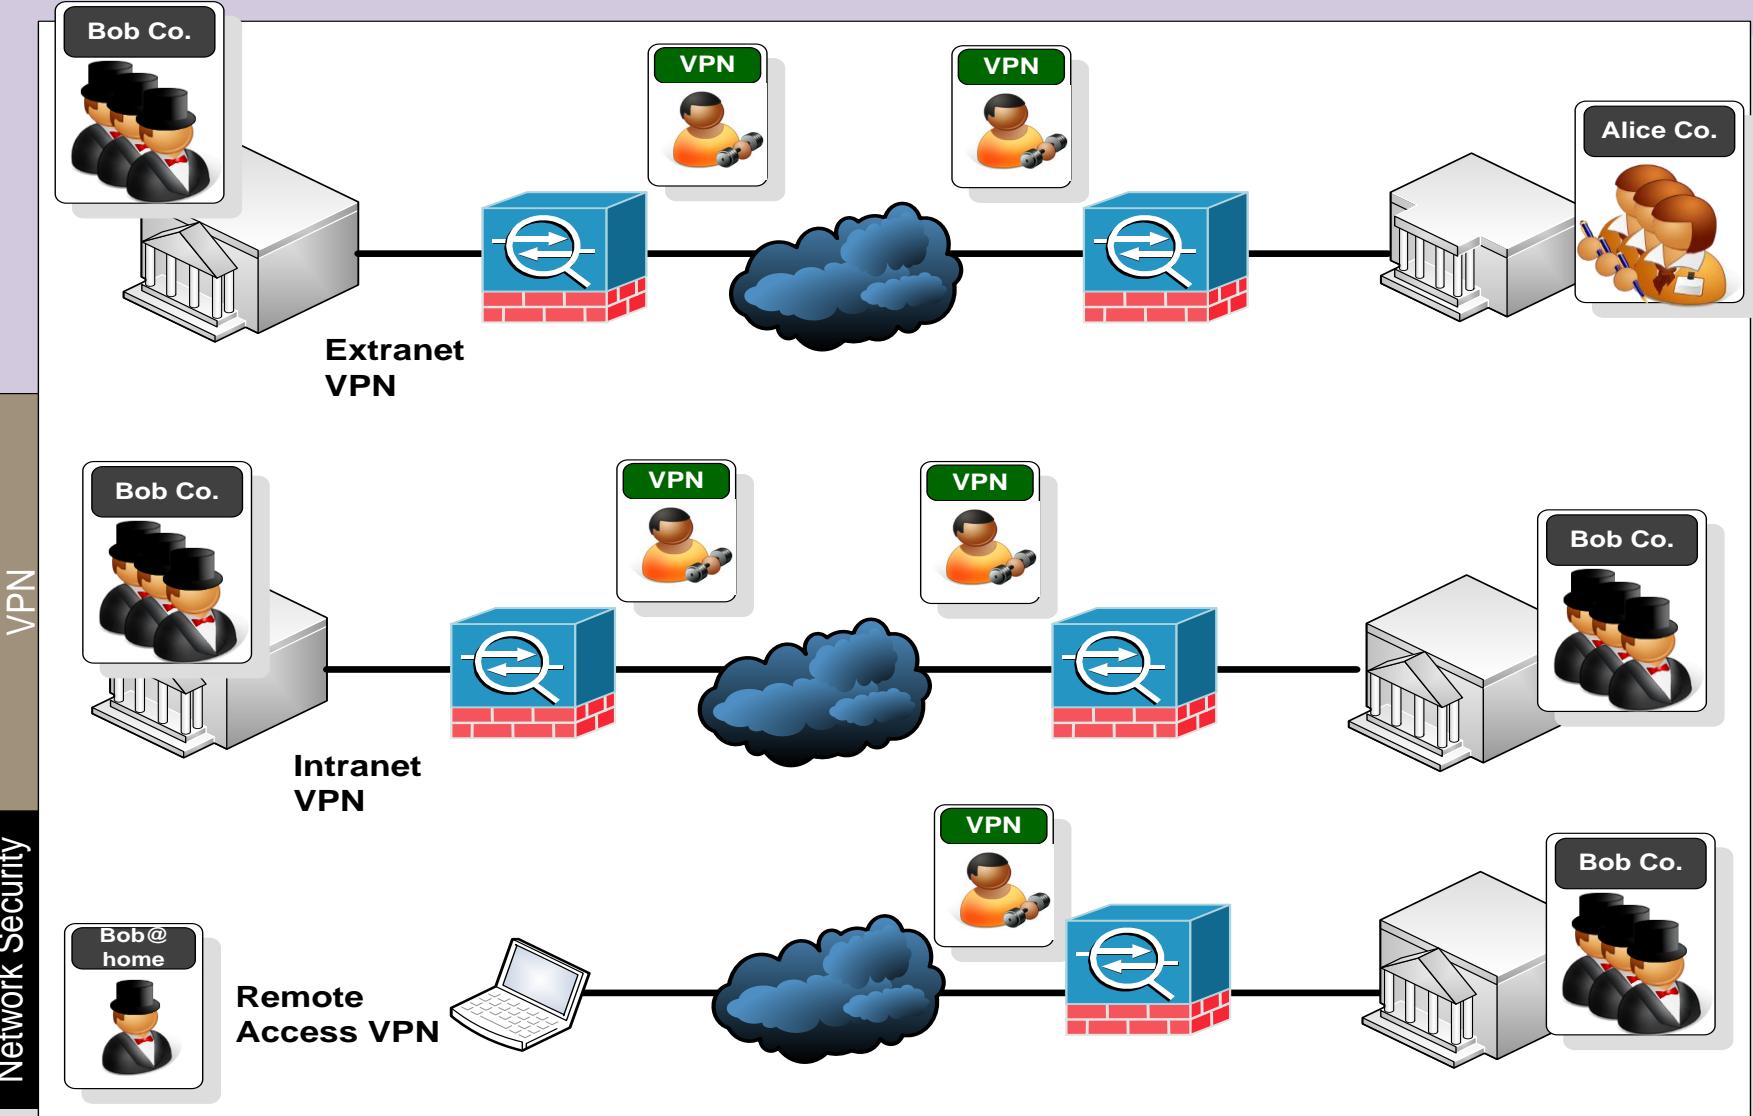

What is required is:

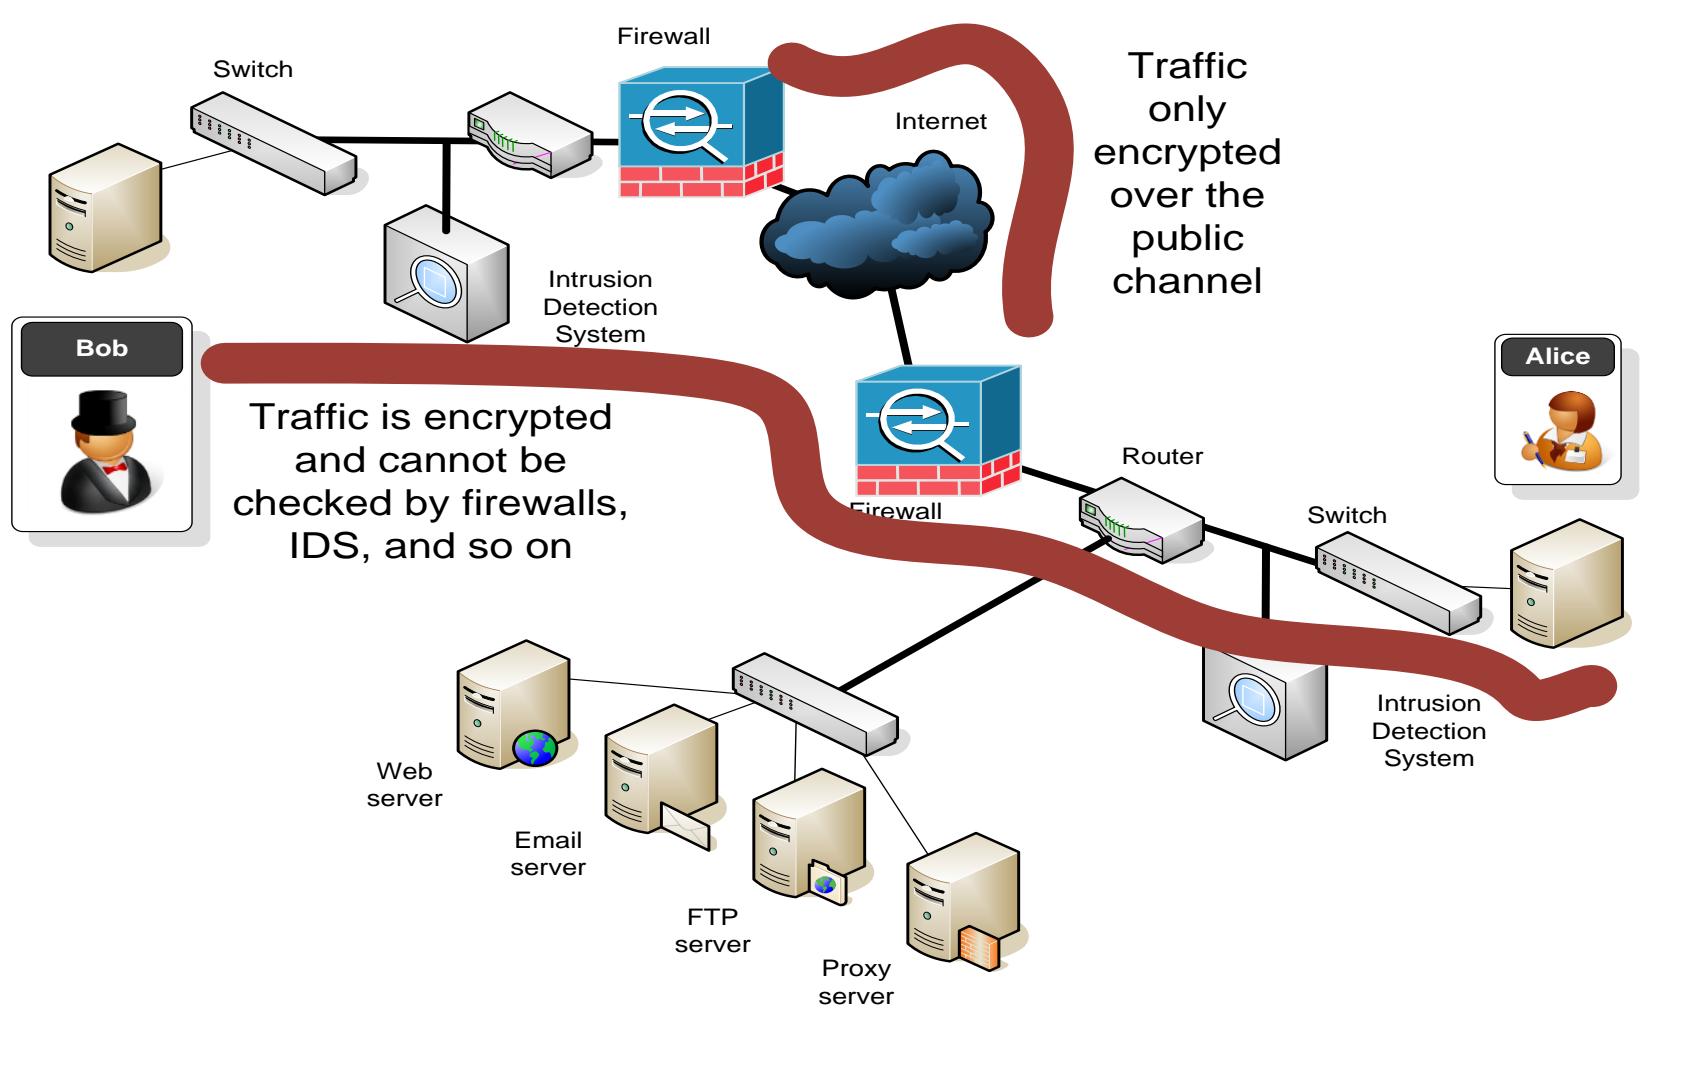

- Encryption.
- Authentication of devices (to overcome spoofing)
- Authentication of packets (for integrity)

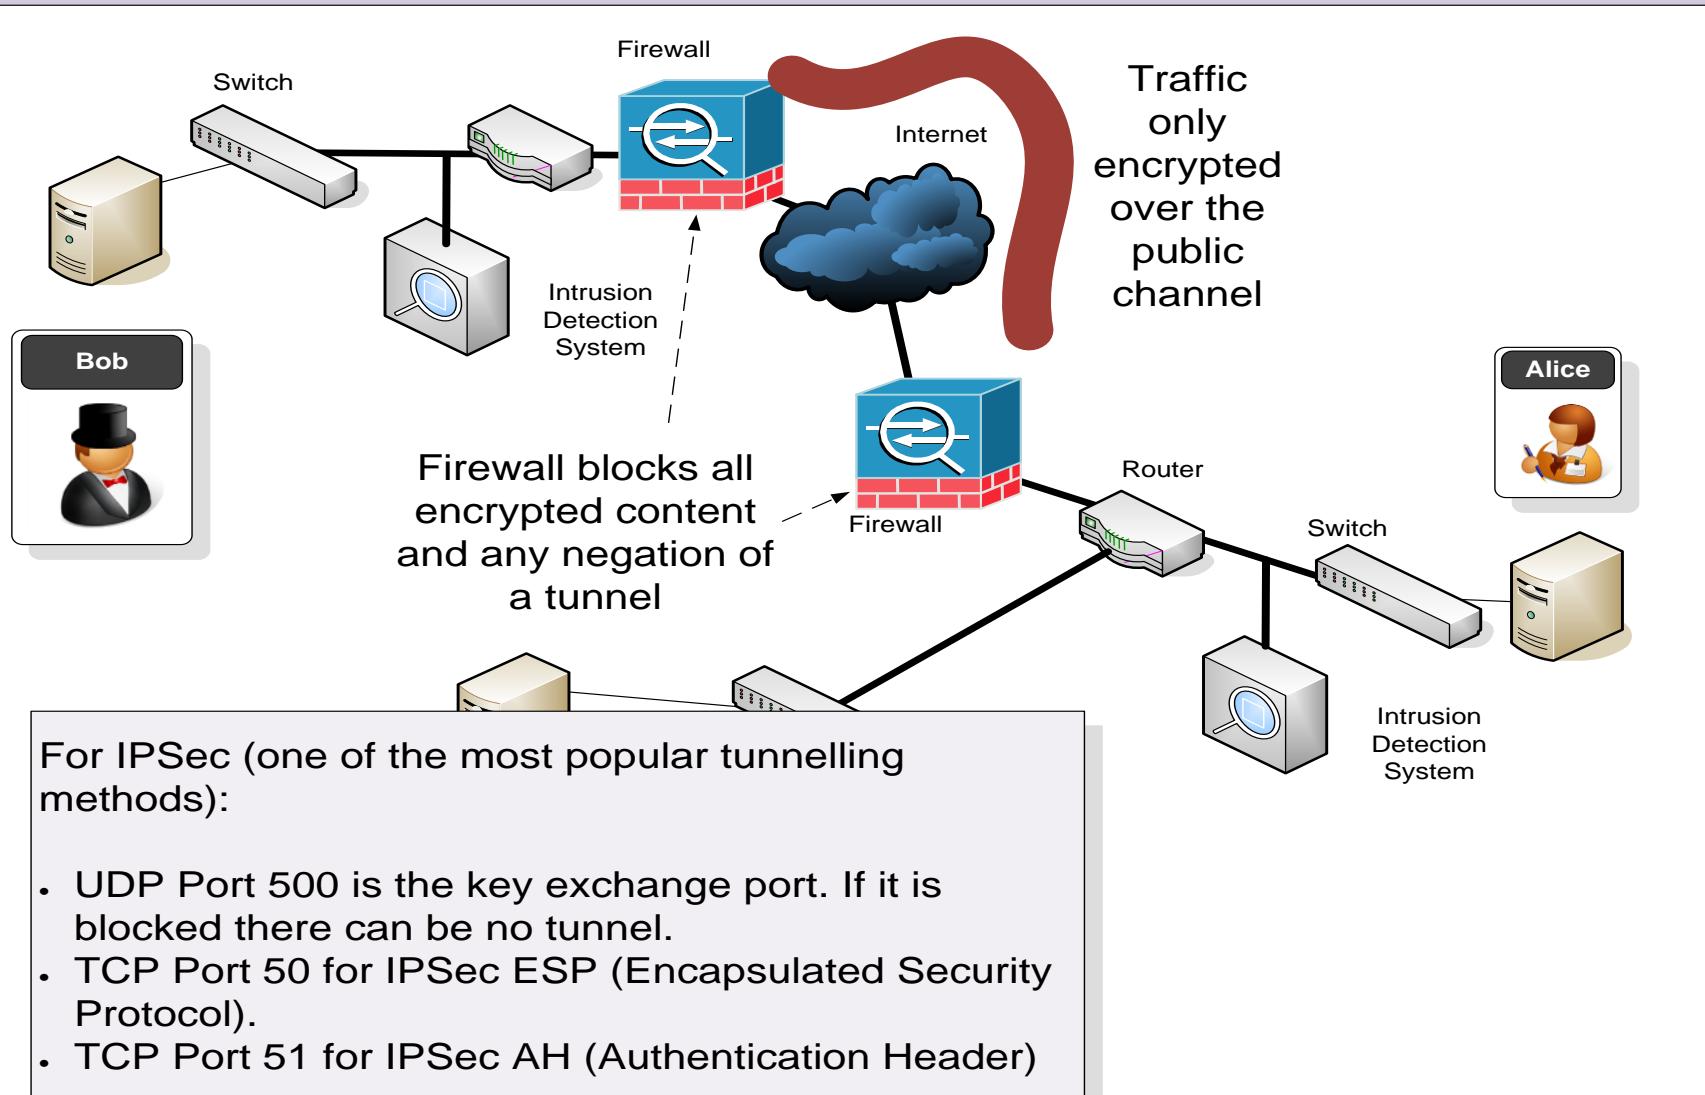

PPTP (Point-to-point Tunneling Protocol). Created by Microsoft and is routable. It uses MPPE (Microsoft Point-to-point Encryption) and user authentication.

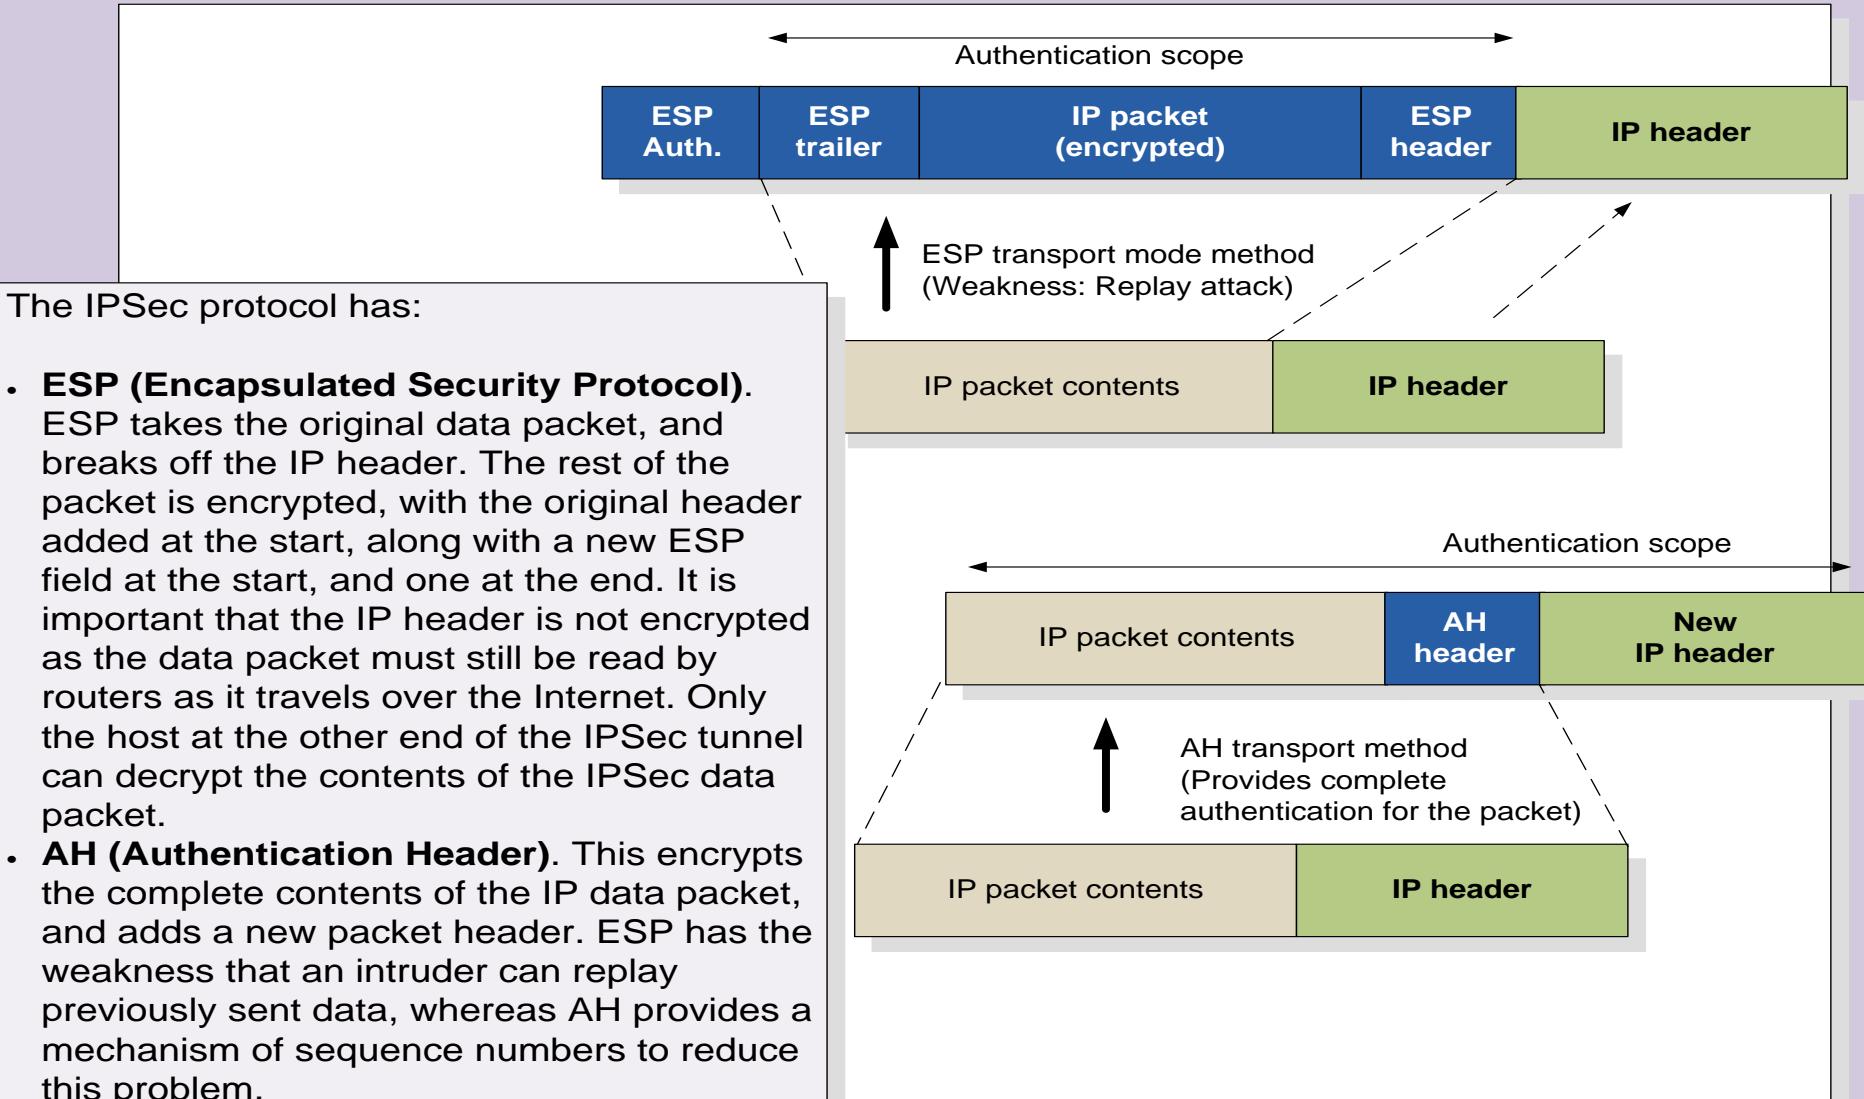

L2TP (Layer 2 Tunneling Protocol). Works at Layer 2 to Forward IP, IPX and AppleTalk (RFC2661). Cisco, Microsoft, Ascent and 3Com developed it. User and machine authentication, but no encryption (but can be used with L2TP over IPSec).

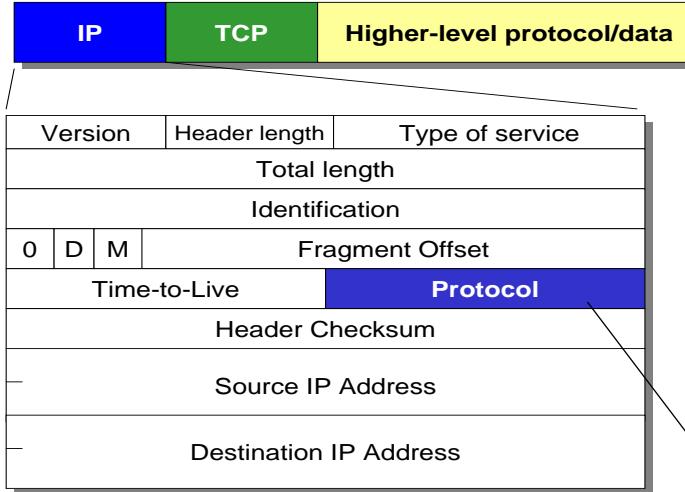

IPSec. An open standard. Includes both encryption and Authentication.

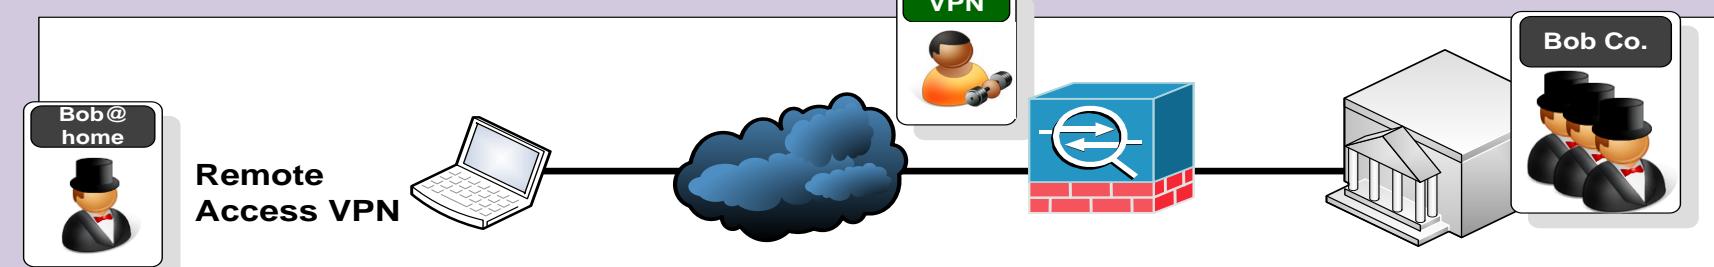

- 1 ICMP Internet Control Message [RFC792]
- 6 TCP Transmission Control [RFC793]
- 8 EGP Exterior Gateway Protocol [RFC888]
- 9 IGP any private interior gateway [IANA]
- 47 GRE General Routing Encapsulation (PPTP)**
- 50 ESP Encap Security Payload [RFC2406]**
- 51 AH Authentication Header [RFC2402]**
- 55 MOBILE IP Mobility
- 88 EIGRP EIGRP [CISCO]
- 89 OSPFIGP OSPFIGP [RFC1583]
- 115 L2TP Layer Two Tunneling Protocol**

Phase 1 (IKE – Internet Key Exchange)

UDP port 500 is used for IKE

Define the policies between the peers

IKE Policies

- Hashing algorithm (SHA/MD5)
- Encryption (DES/3DES)
- Diffie-Hellman agreements
- Authentication (pre-share, RSA nonces, RSA sig).

```
isakmp enable outside
isakmp key ABC&FDD address 176.16.0.2 netmask
255.255.255.255
isakmp identity address
isakmp policy 5 authen pre-share
isakmp policy 5 encrypt des
isakmp policy 5 hash sha
isakmp policy 5 group 1
isakmp policy 5 lifetime 86400
sysopt connection permit-ipsec
```

Phase 2

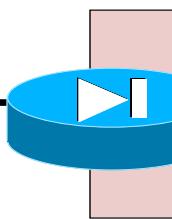

Defines the policies for transform sets, peer IP addresses/hostnames and lifetime settings.

Crypto maps are exchanged

- AH, ESP (or both)
- Encryption (DES, 3DES)
- ESP (tunnel or transport)
- Authentication (SHA/MD5)
- SA lifetimes defined
- Define the traffic of interest

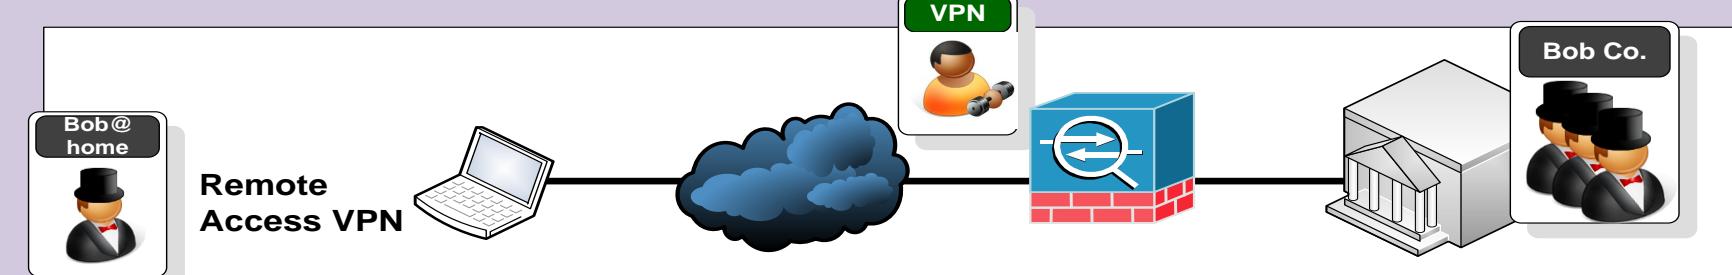

```
crypto ipsec transform-set MYIPSECFORMAT esp-des esp-sha-hmac
crypto map MYIPSEC 10 ipsec-isakmp
access-list 111 permit ip 10.0.0.0 255.255.255.0 176.16.0.0
255.255.255.0
crypto map MYIPSEC 10 match address 111
crypto map MYIPSEC 10 set peer 176.16.0.2
crypto map MYIPSEC 10 set transform-set MYIPSECFORMAT
crypto map MYIPSEC interface outside
```
