

Wireless LAN

Unit 3: Wireless Infrastructure

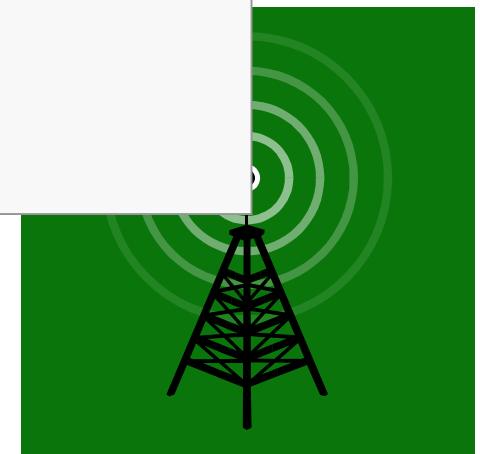

Areas covered:

Wireless Infrastructures.

Basic details on bridging and topologies.

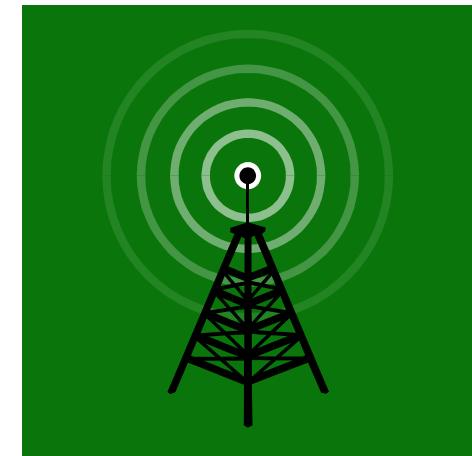

Wireless Data Logging and Device Discovery.

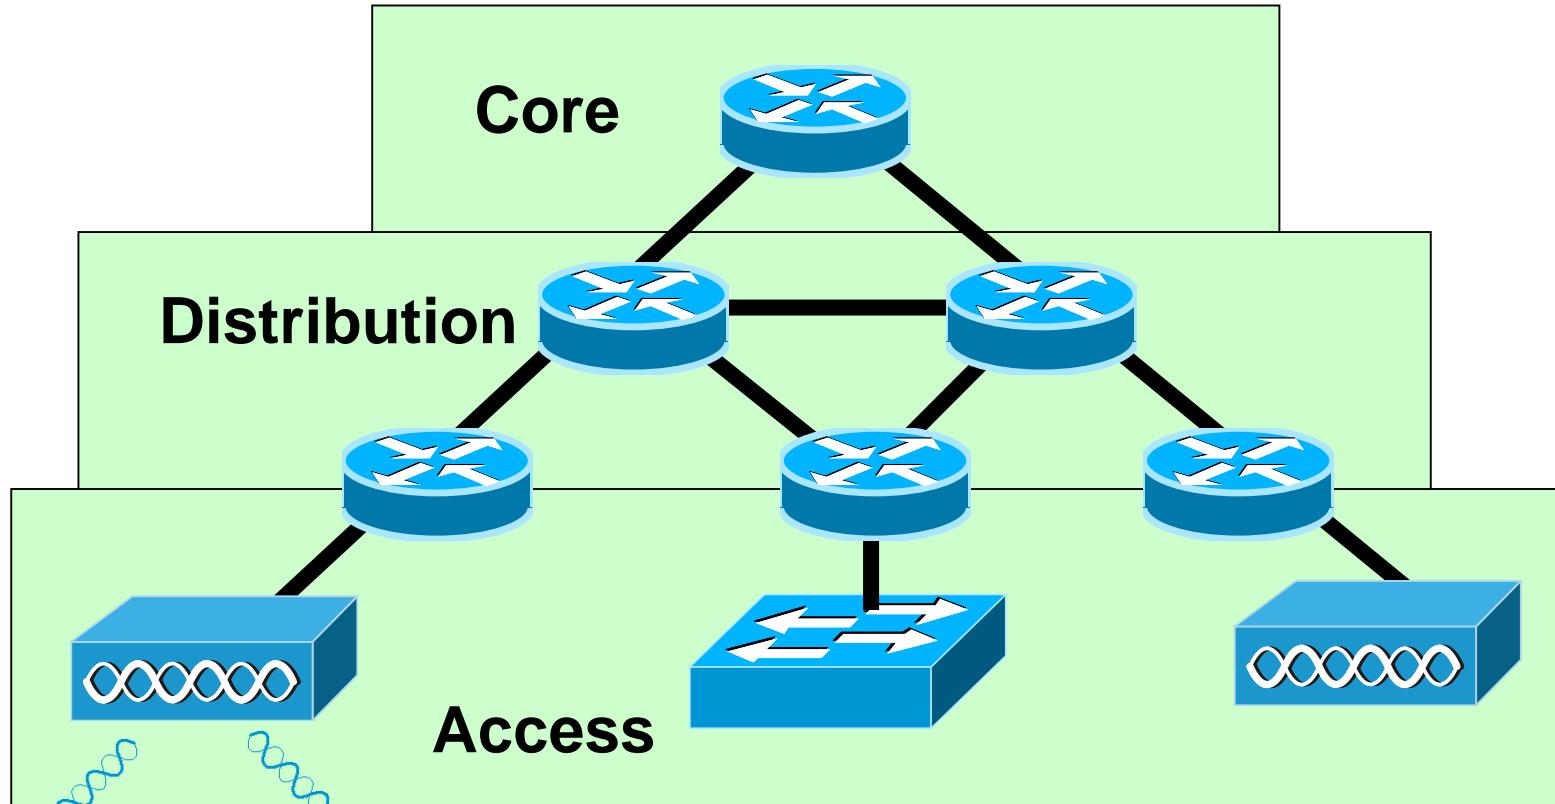

Details on protocols such as SNMP

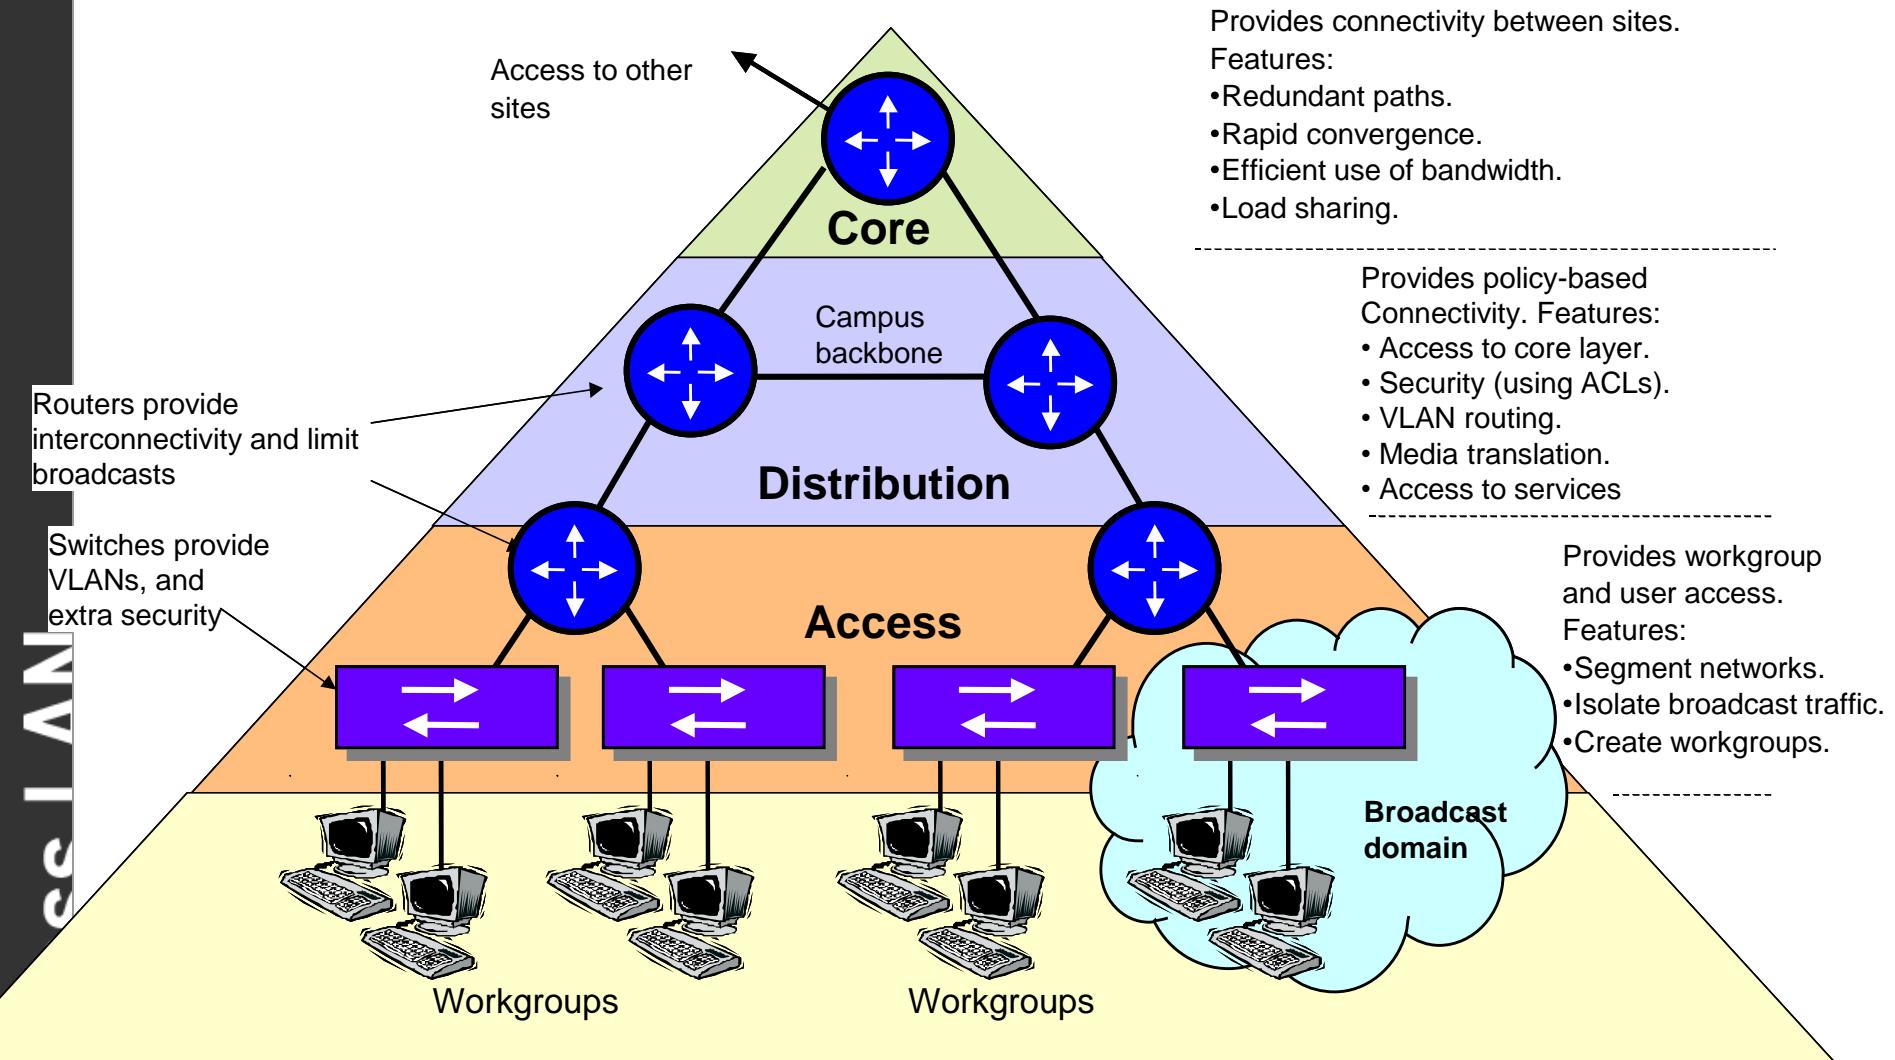

Wireless LAN

Wireless Infrastructures

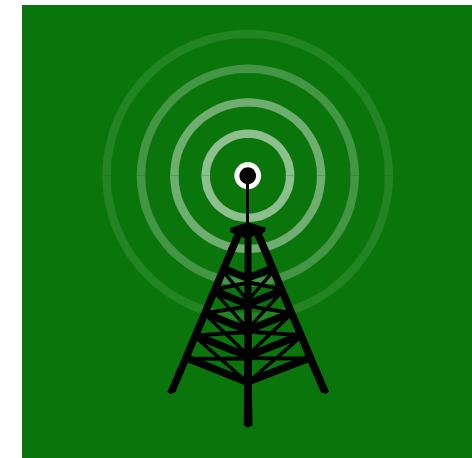

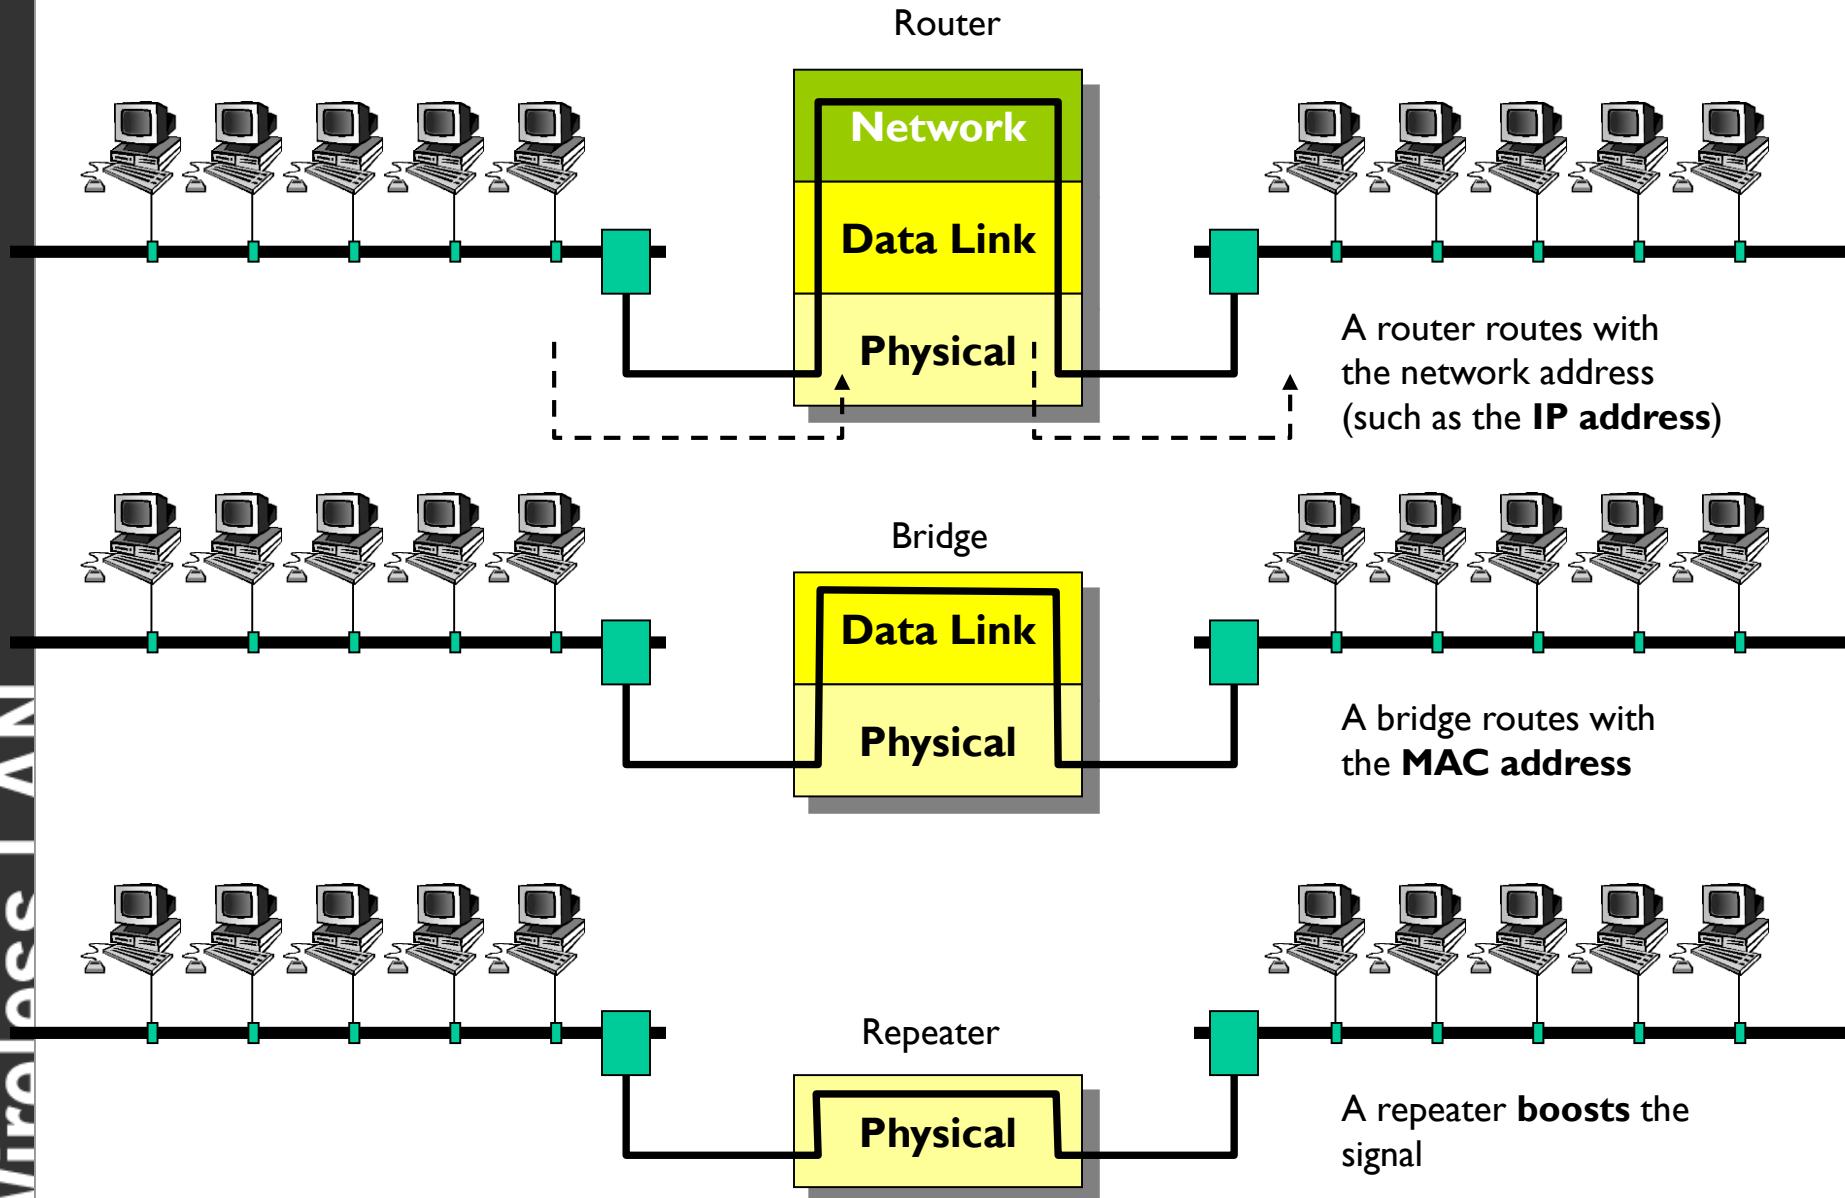

Three-layered model

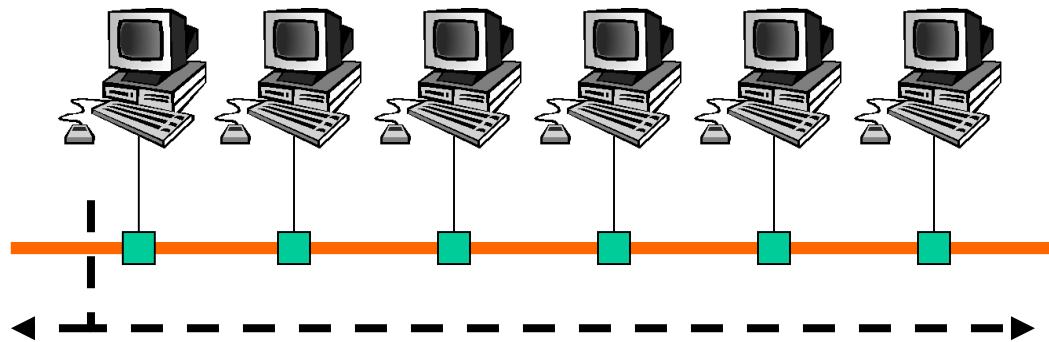

Wireless LAN

Root or repeater

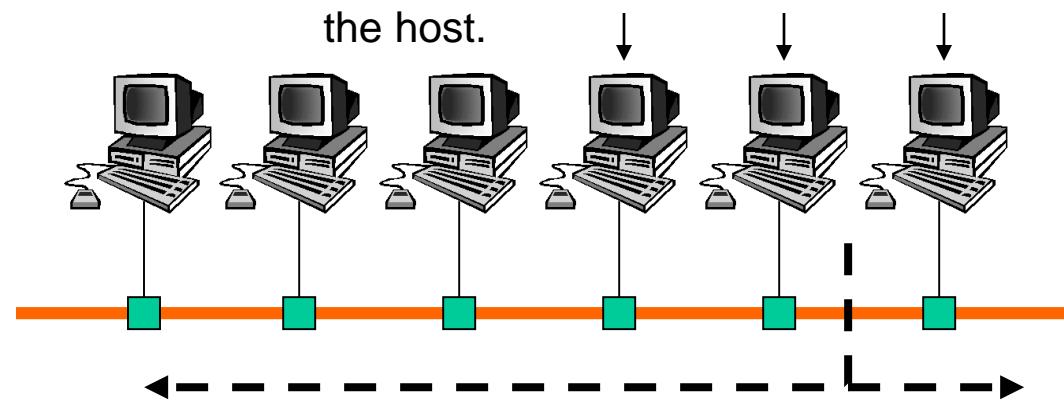

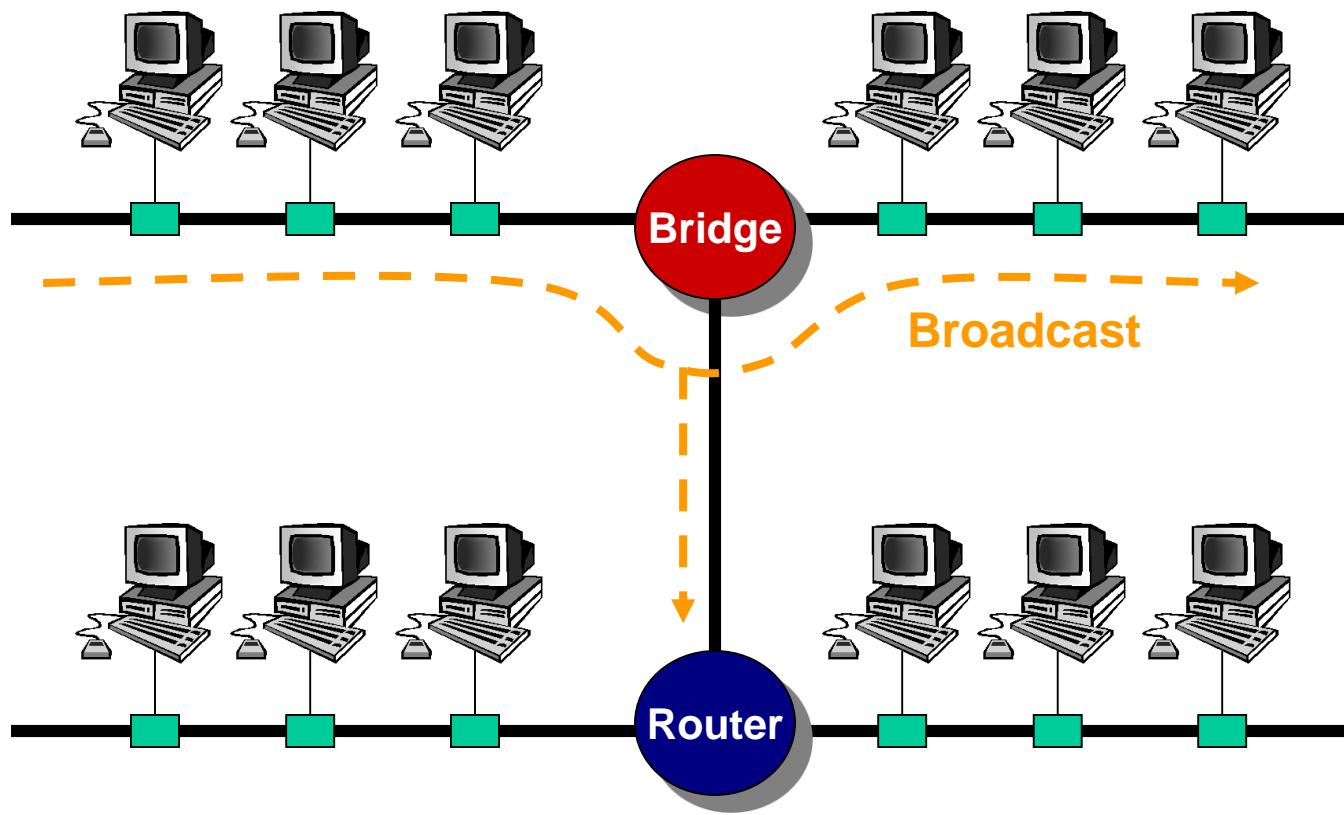

1. Broadcast: What is the MAC address of this network address?

3. Updated ARP table: All the hosts update their ARP table with the correct IP and MAC address for the host.

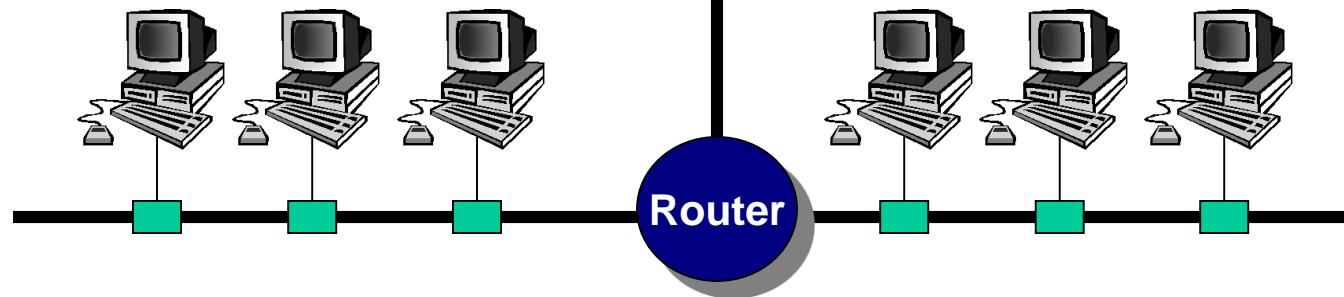

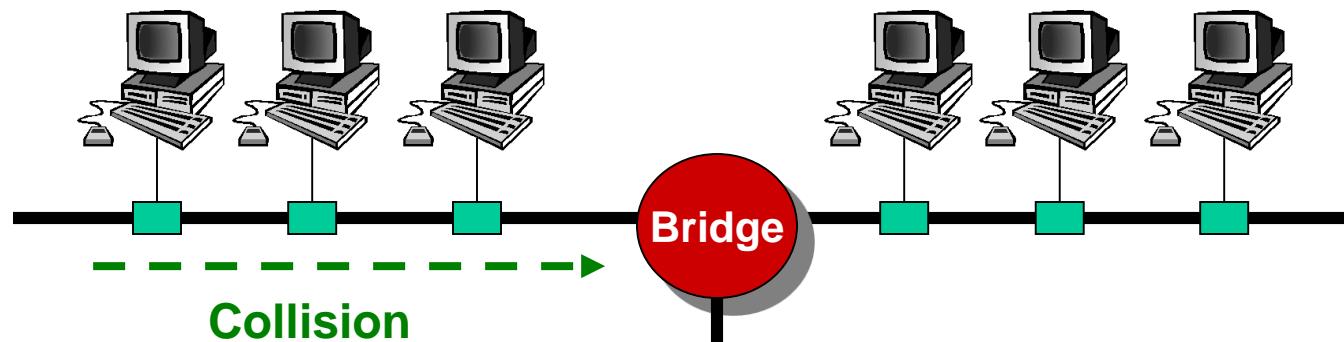

2. Requested host: All the hosts read the broadcast and checks if it relates to them. If it does then they respond back with their MAC address.

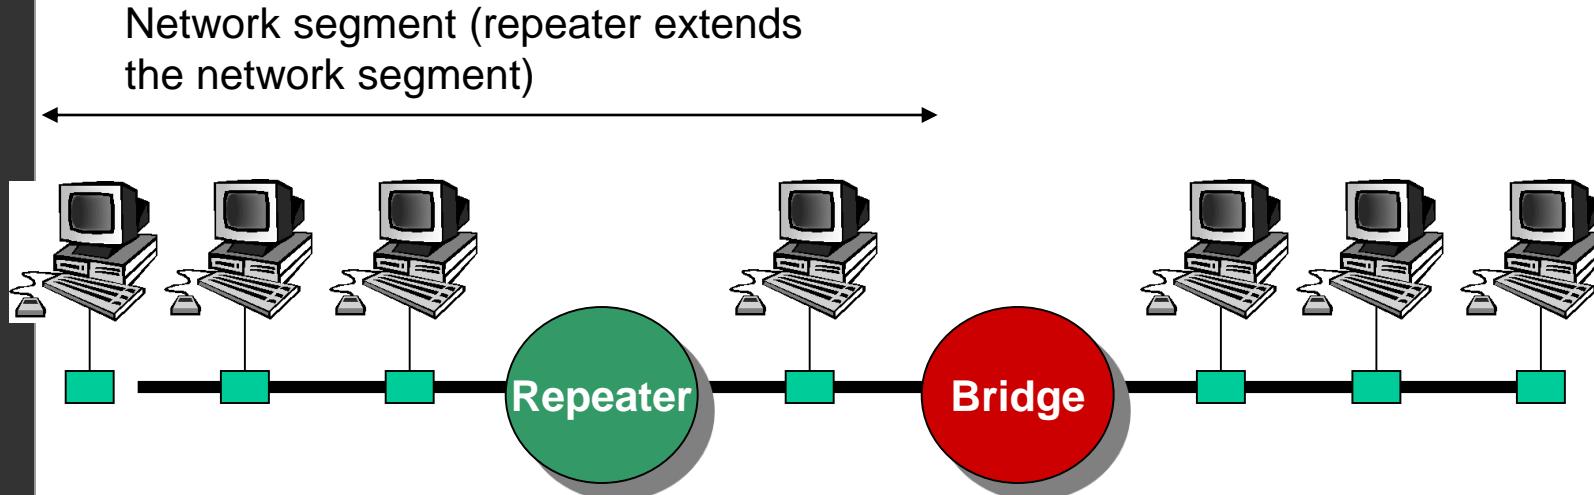

**Repeaters:
Bridges:
Routers:**

Forward broadcasts
Forward broadcasts
Block broadcasts

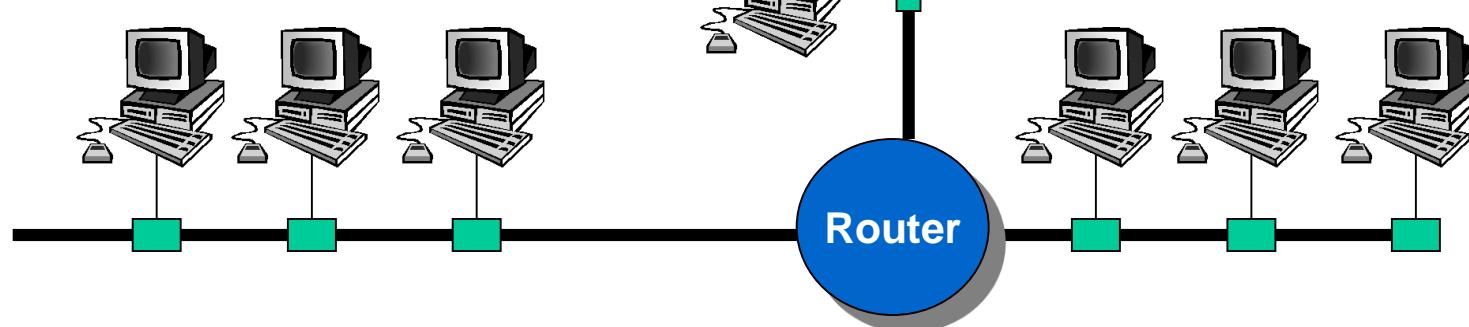

Repeaters:
Bridges:
Routers:

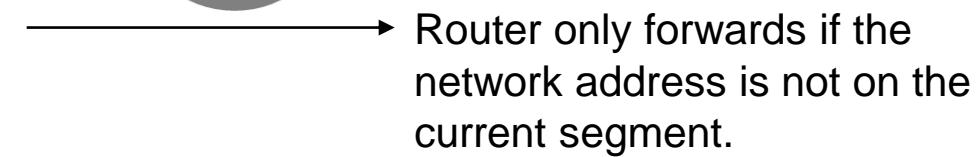

Forward collisions
Block collisions
Block collisions

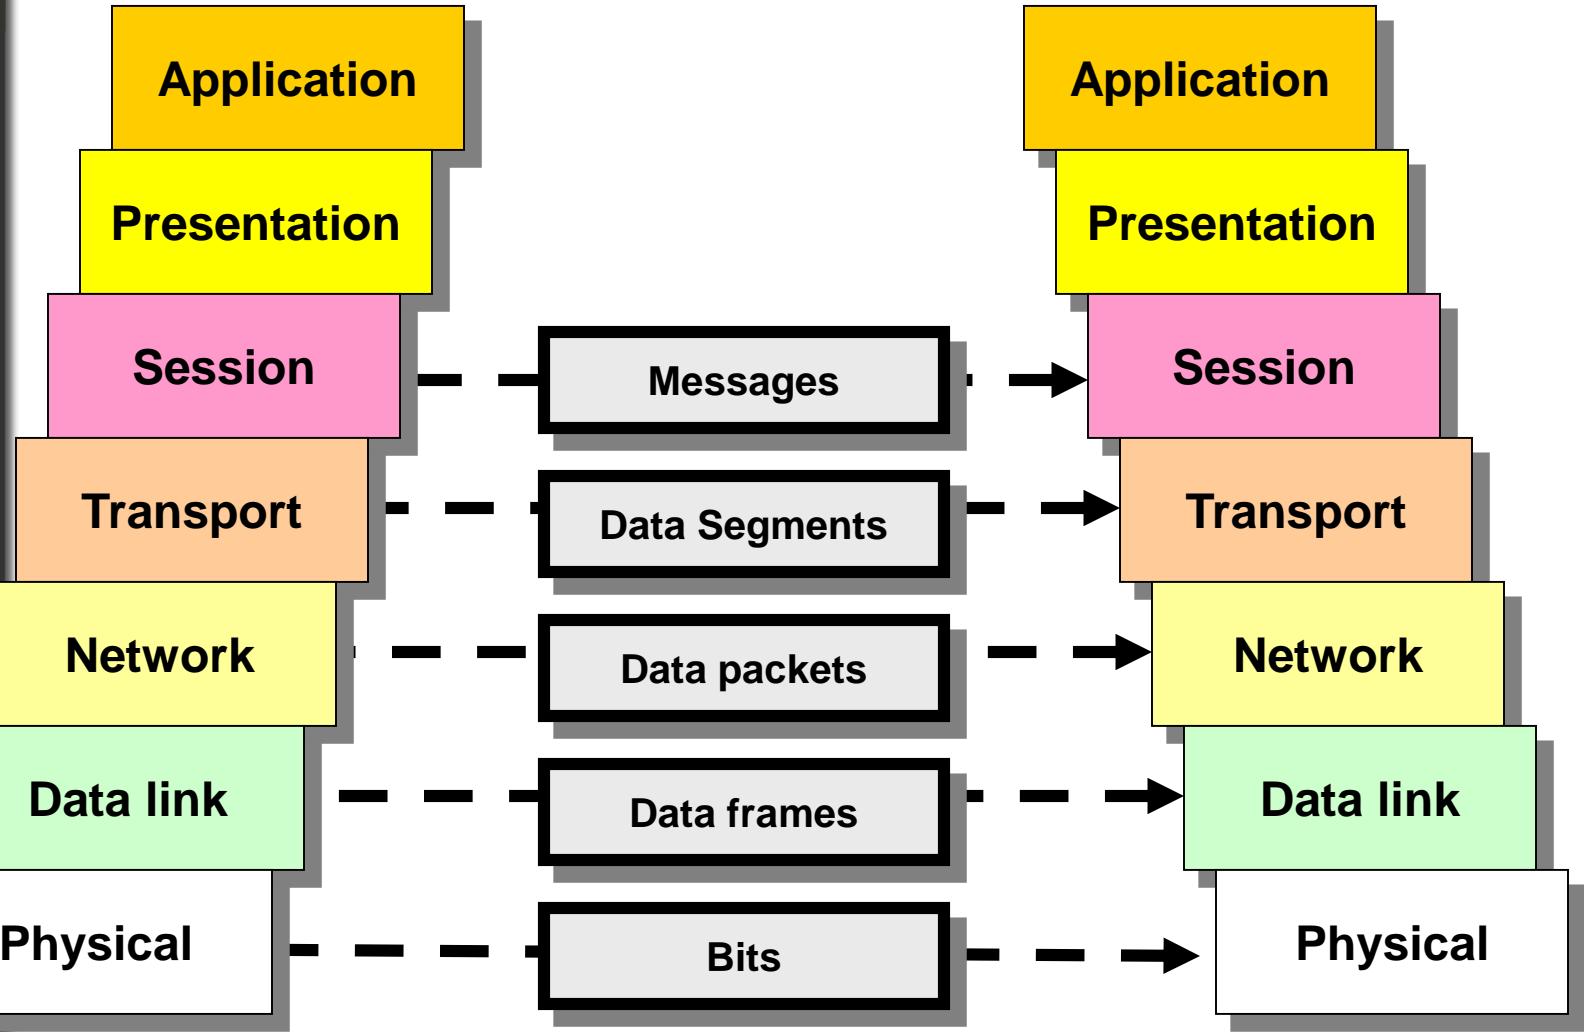

Network segment (repeater extends the network segment)

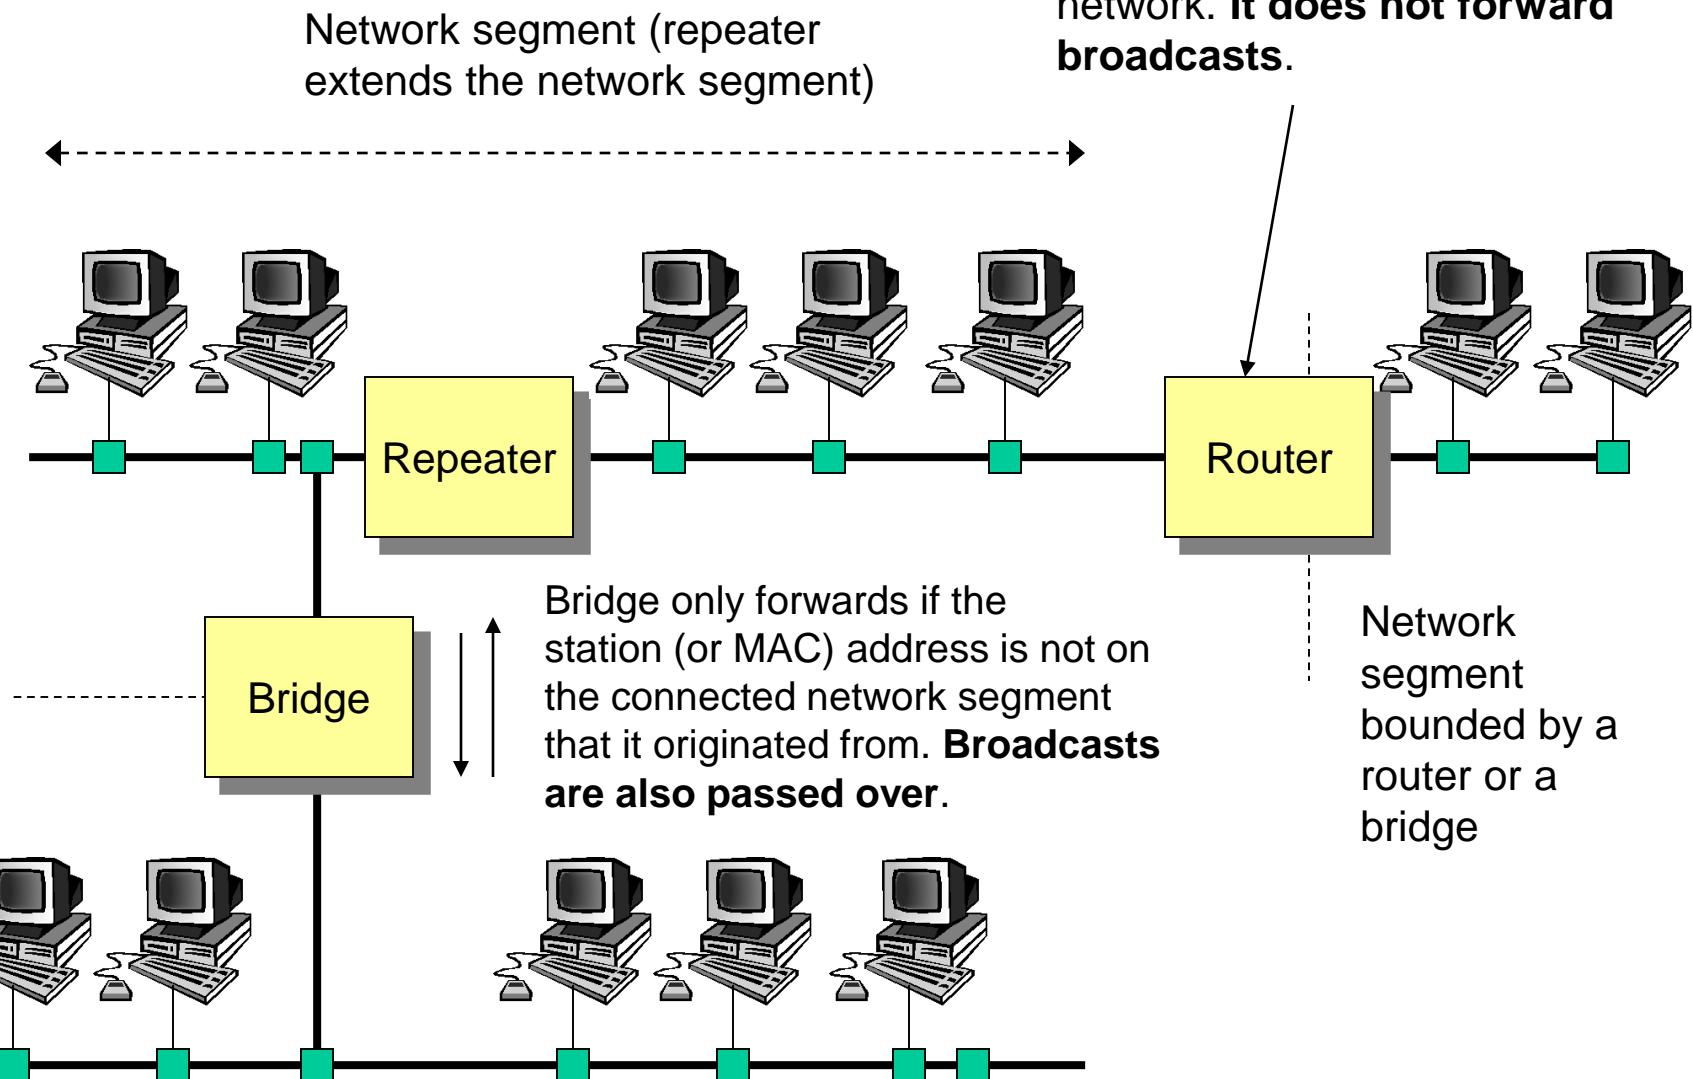

Bridge only forwards if the MAC address is not on the current segment.

Router only forwards if the network address is not on the current segment.

Repeaters, bridges and routers

Router only forwards if the network address is on **another** network. **It does not forward broadcasts.**

Network segment bounded by a router or a bridge

Network

Data Link

Physical

Routers:

Block broadcasts
Block collisions

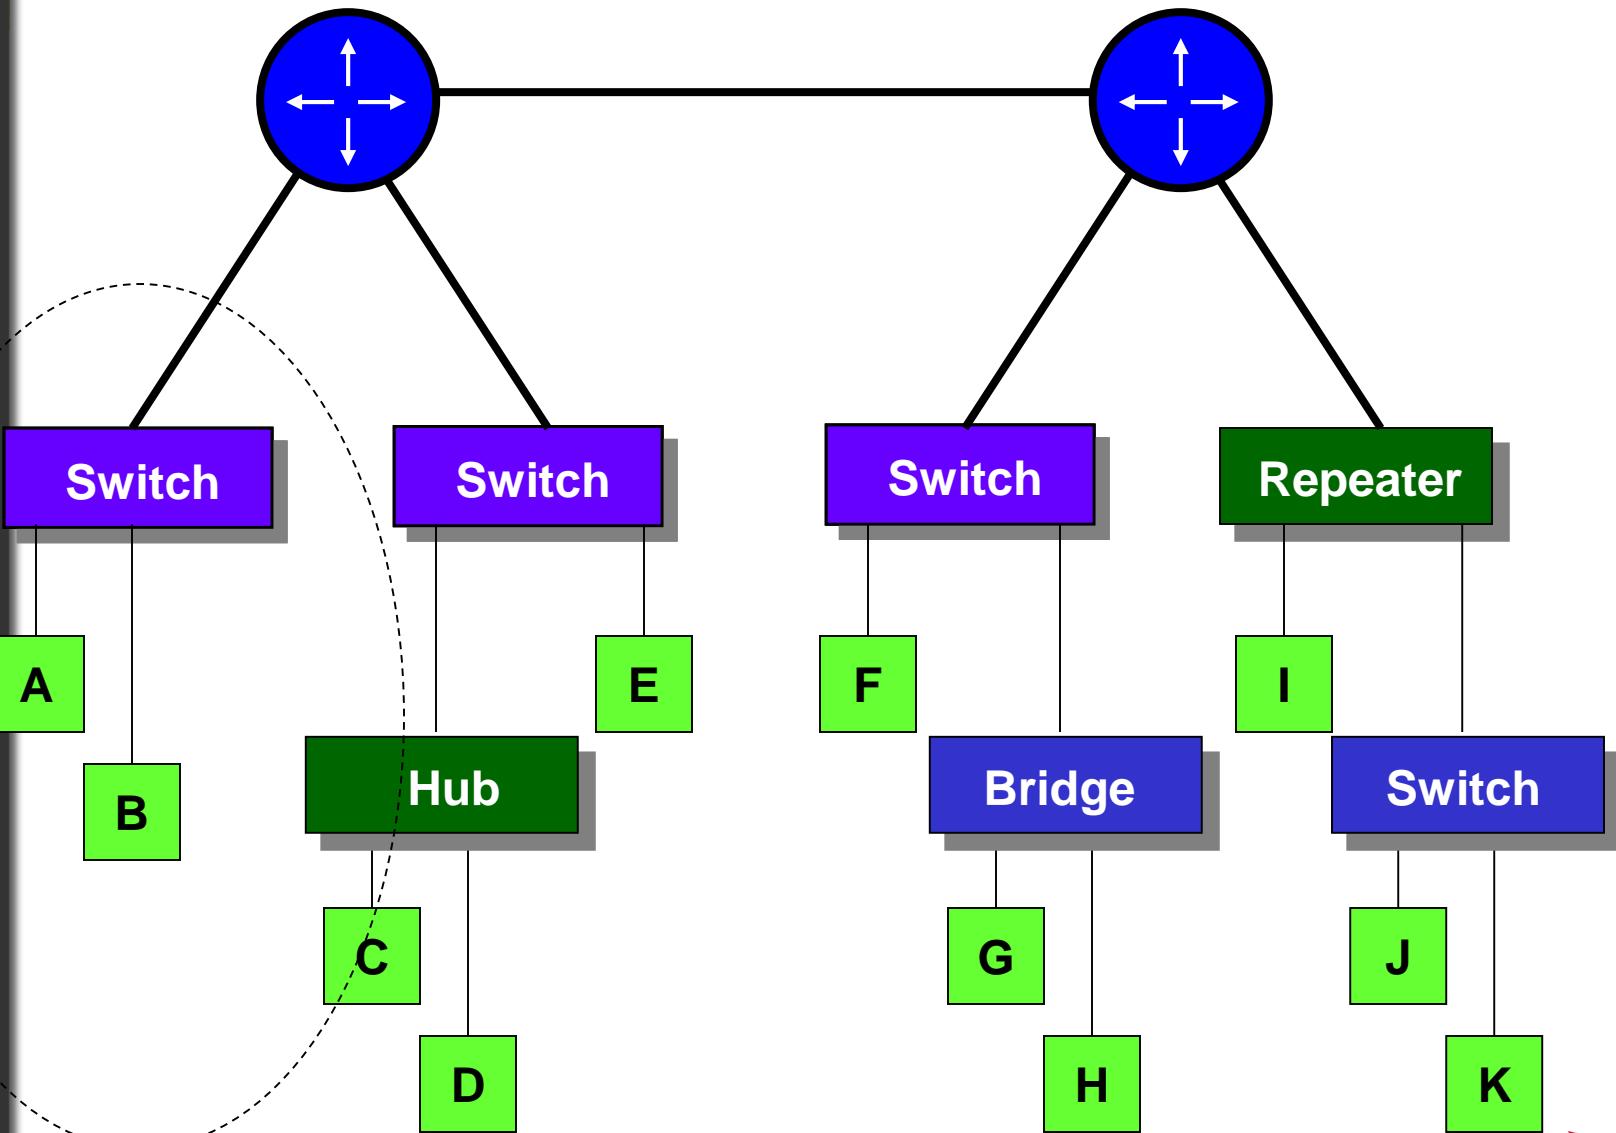

Bridges/switches: Forward broadcasts
Block collisions

Hub/repeaters:

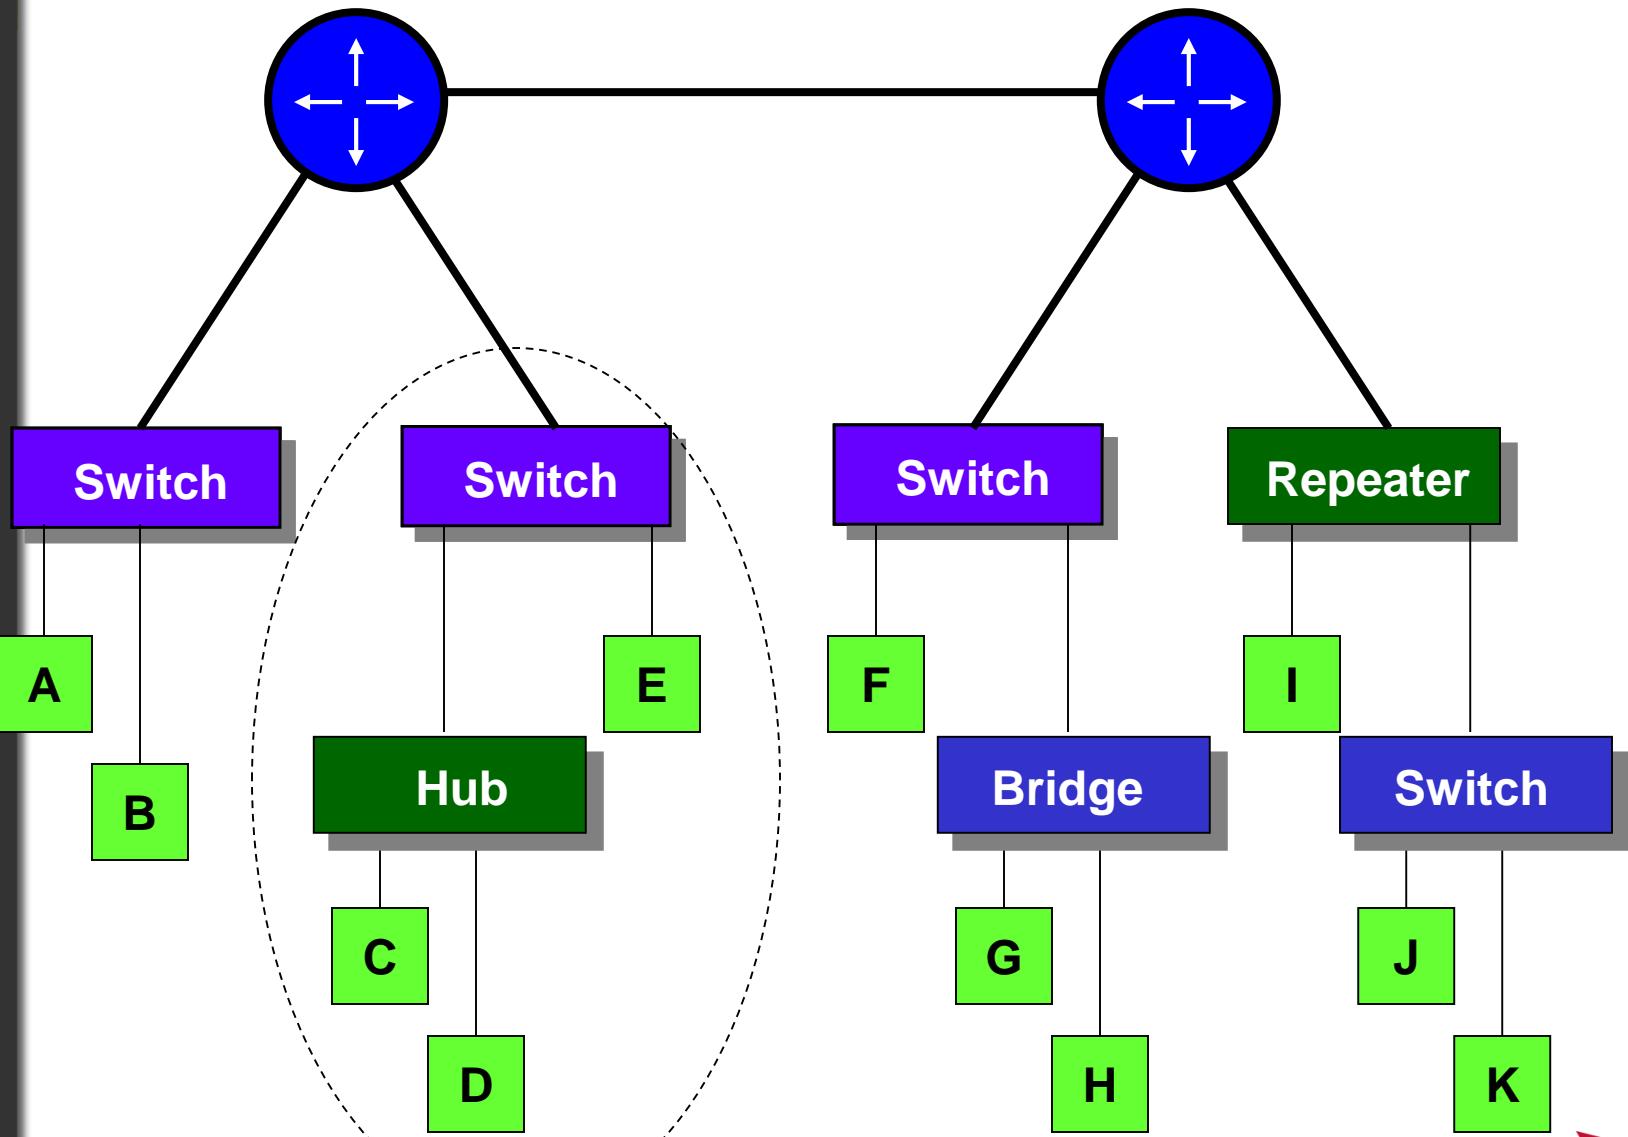

Forward broadcasts

Remote Access

CONSOLE Port

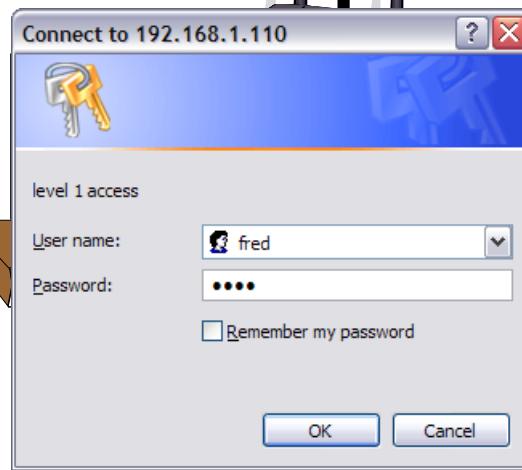

Dial-in access

The image displays two windows demonstrating Cisco networking management. The top window is 'HyperTerminal' titled 'It: - HyperTerminal', showing a command-line interface with configuration commands like 'show', 'ssh', 'telnet', and 'ap#config t'. The bottom window is a Microsoft Internet Explorer browser titled 'Cisco Series AP - Home - Microsoft Internet Explorer', showing the 'Cisco 1200 Access Point' configuration page with details such as 'Hostname: ap', 'IP Address: 192.168.1.110', and a log of events.

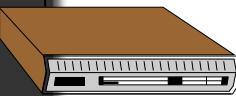

CON Port

```
# config t  
(config) # username fred password bert  
(config) # ip http server  
(config) # ip http authentication local  
(config) # exit
```

CONSOLE
Port

```
(config) # ip http port 8080
```

PUBLIC

The screenshot shows a Microsoft Internet Explorer window titled "Cisco IOS Series AP - Home - Microsoft Internet Explorer". The address bar contains "http://192.168.1.110:8080". The main content area displays the "Cisco 1200 Access Point" configuration interface. On the left is a navigation menu with items: HOME, EXPRESS SET-UP, NETWORK MAP, ASSOCIATION, NETWORK INTERFACES, SECURITY, SERVICES, and WIRELESS SERVICES. The "ASSOCIATION" item is expanded. The right side shows a summary status with "Hostname ap" and "Home: Summary Status". Below this are sections for "Association" (Clients: 0, Repeaters: 0), "Network Identity", and "Wireless Services". At the bottom, there are links for "Done", "Internet", and "Help".

Wireless LAN

CDP

Wireless LAN

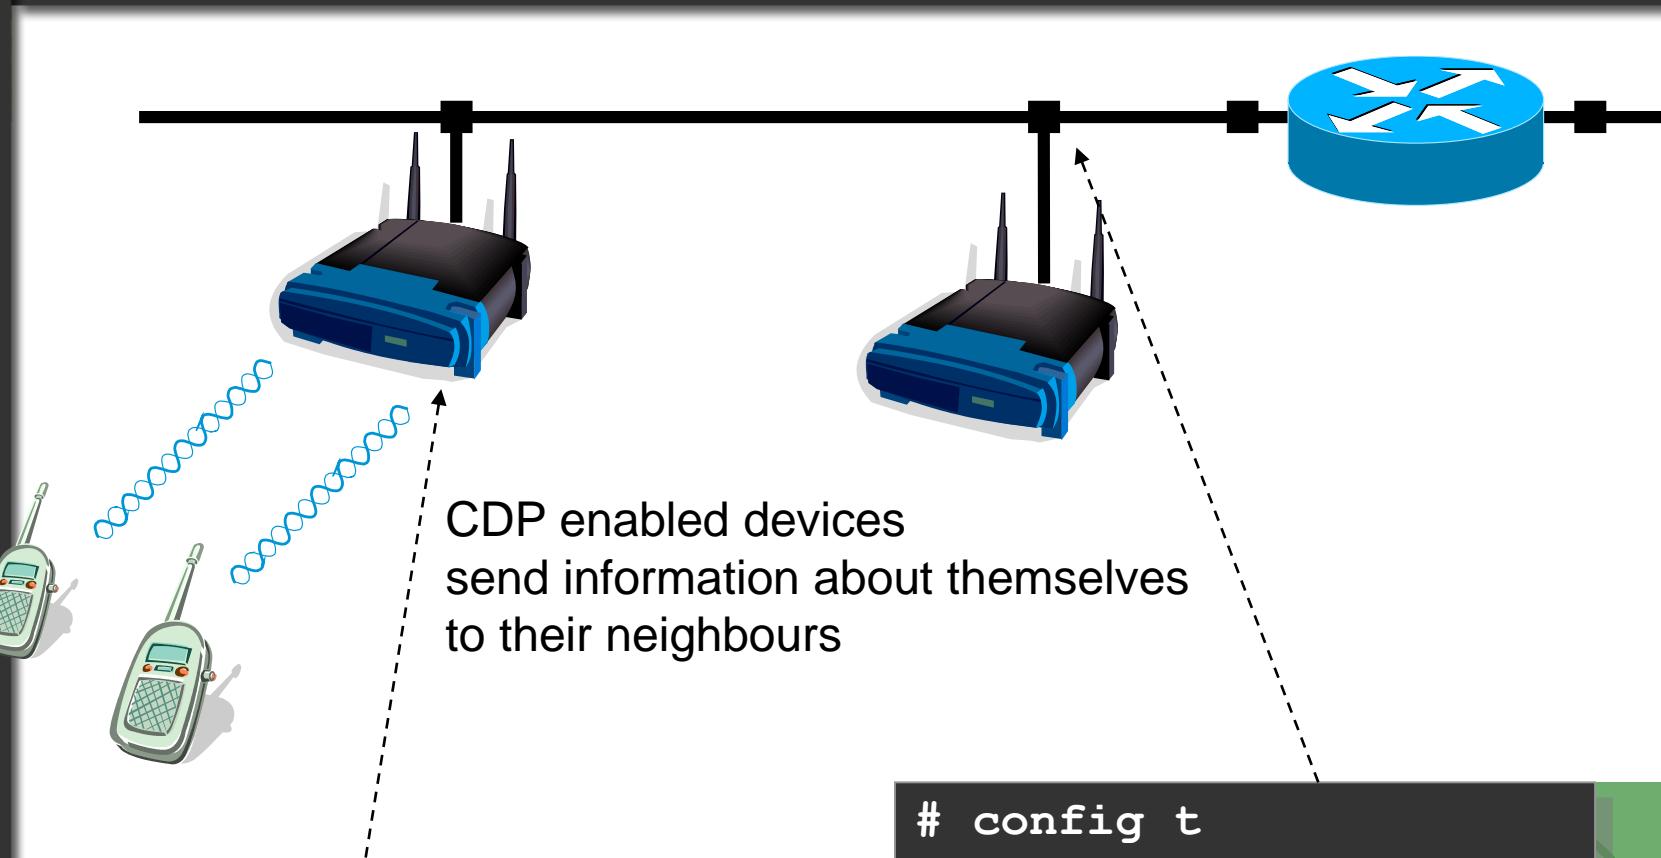

Centre for Dist Computing and Security
Prof W Buchanan

```
# config t
(config)# cdp holdtime 120
(config)# cdp timer 50
```

```
# show cdp neighbors
# show cdp neighbors detail
# show cdp neighbors traffic
```

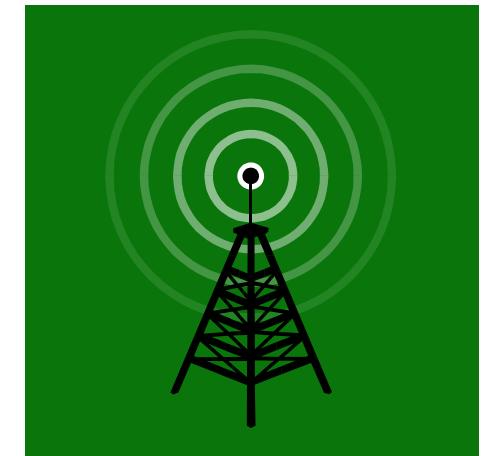

CDP enabled devices
send information about themselves
to their neighbours

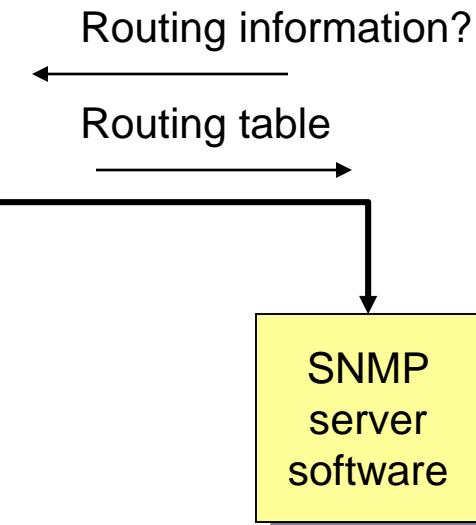

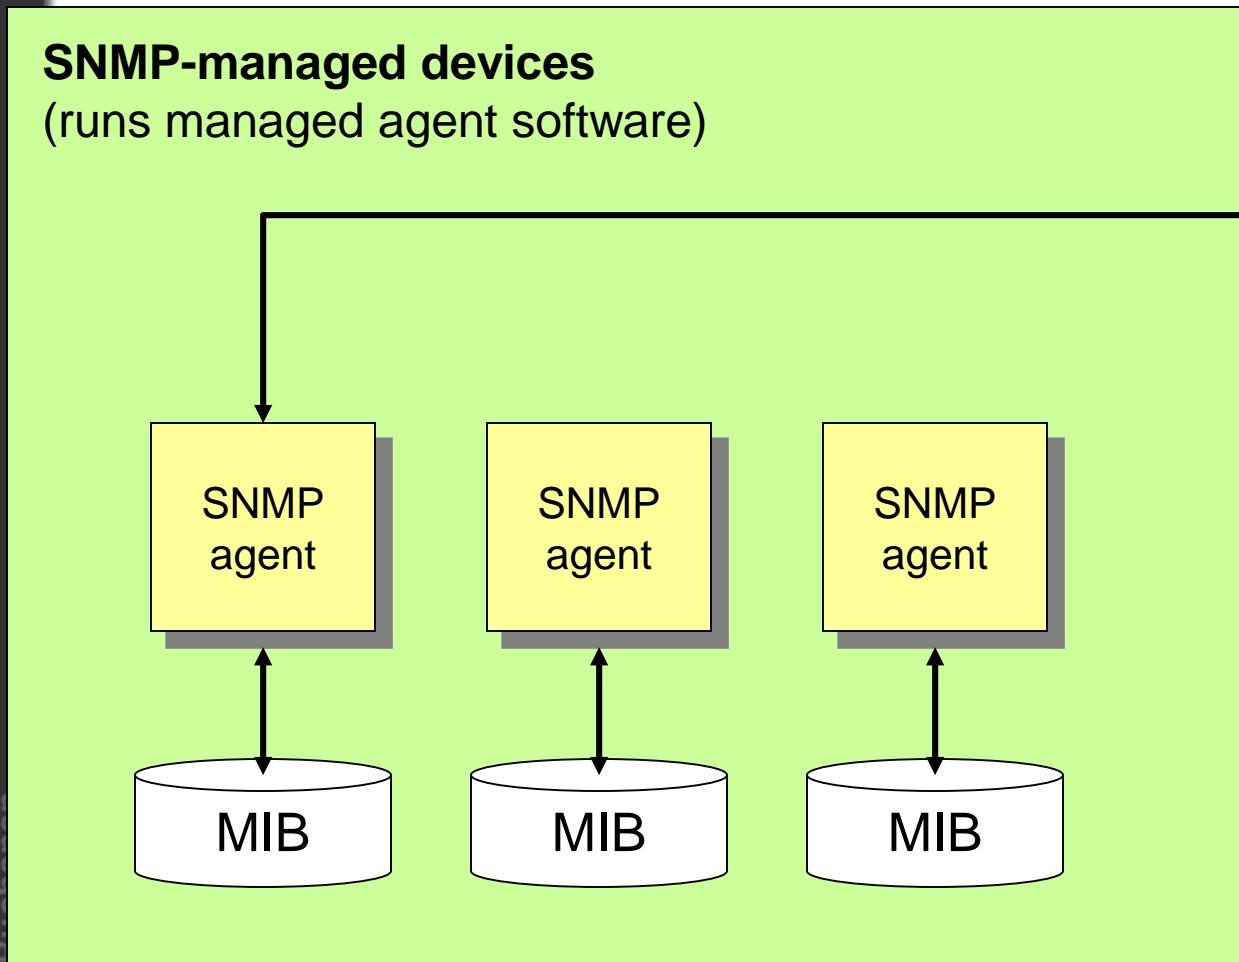

```
# config t
(config)# int fa0
(config-if)# cdp enable
(config-if)# end
```

Wireless LAN

SNMP

- The SNMP (Simple Network Management Protocol) protocol is initially based in the RFC1157 document.
- It defines a simple protocol which gives network element management information base (MIB).
- There are two types of MIB: MIB-1 and MIB-2. MIB-1 was defined in 1988 and has 114 table entries, divided into two groups. MIB-2 is a 1990 enhancement which has 171 entries organized into 10 groups (RFC 1213). Most devices are MIB-1 compliant and newer one with both MIB-1 and MIB-2.

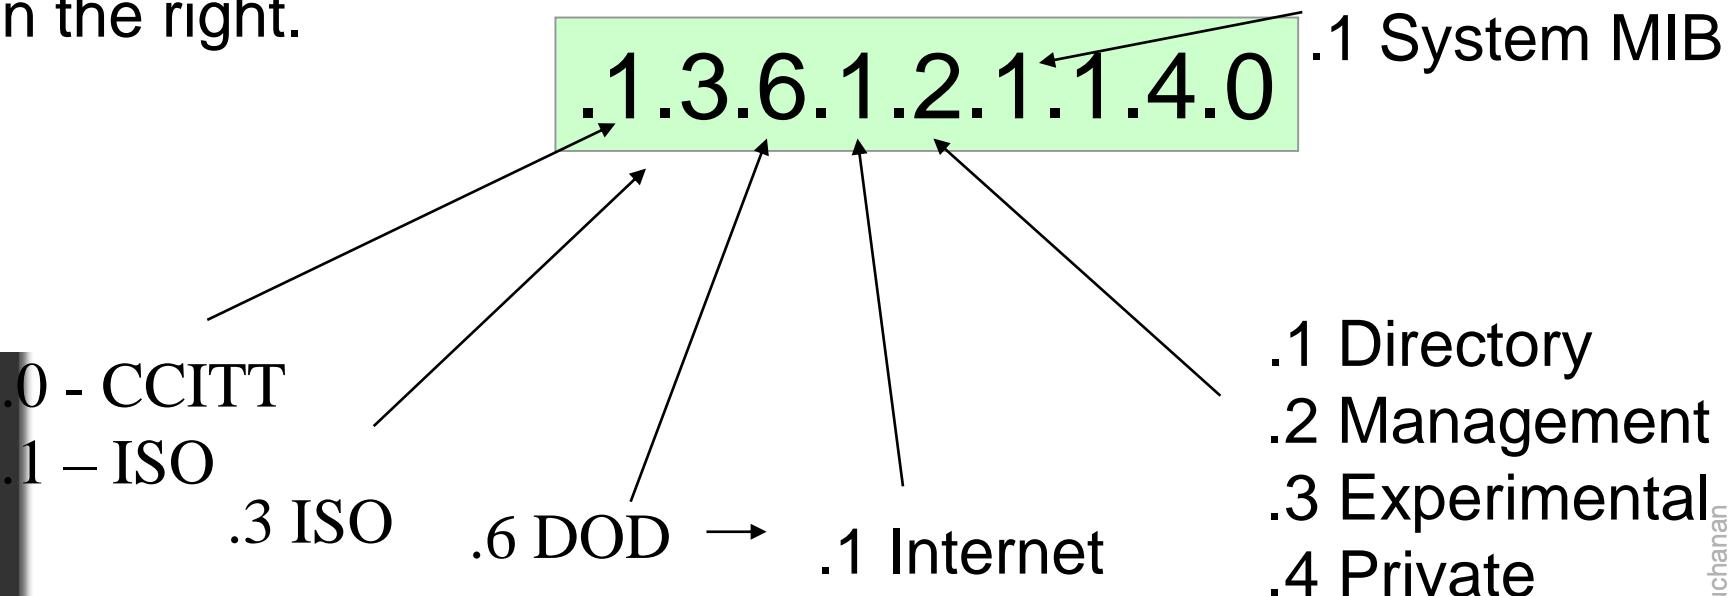

Version	Authentication	Encryption
<i>v1 Community</i> !Trivial authentication.	strings Packets sent in clear-text.	None
<i>v2c Community</i> !Trivial authentication.	strings Packets sent in clear-text.	None
<i>v3(noAuthNoPriv)</i> !Trivial authentication.	Username Packets sent in clear-text.	None
<i>v3(authNoPriv)</i> SHA or MD5 None Strong authentication.	encrypted pass phrase Packets sent in clear-text.	
<i>v3(authPriv)</i> !DES Strong authentication. Packets are encrypted.	SHA or MD5	encrypted pass phrase

- **Object type.** Defines the name of the entry.
- **Syntax.** Gives the actual value (as string or an integer).
- **Access field.** Defines whether the value is read-only, read/write, write-only and not accessible.
- **Status field.** Contains an indication on whether the entry in the MIB is mandatory (the managed device must implement the entry), optional (the managed device may implement the entry) or obsolete (the entry is not used).

The network management protocol operates by inspecting or altering variables on an agent's MIB (management information base). They communicate by exchanging messages within UDP datagrams, with:

- A Version identifier (version). An integer value defining the version number.
- SNMP community name (community). An eight character string defining the community name.
- A protocol data unit (data). All SNMP implementations five PDUs: GetRequest-PDU, GetNextRequest-PDU, GetResponse-PDU, SetRequest-PDU, and Trap-PDU.

- The MIB tree structure is defined by a long sequence of numbers separated by dots, such as .1.3.6.1.2.1.1.4.0. This number is called an **Object Identifier** (OID).
- The OID is a numerical representation of the MIB tree structure. Each digit represents a node in this tree structure. The trunk of the tree is on the left; the leaves are on the right.

- The MIB tree structure is defined by a long sequence of numbers separated by dots, such as .1.3.6.1.2.1.1.4.0. This number is called an **Object Identifier** (OID).
- The OID is a numerical representation of the MIB tree structure. Each digit represents a node in this tree structure. The trunk of the tree is on the left; the leaves are on the right.

End of node

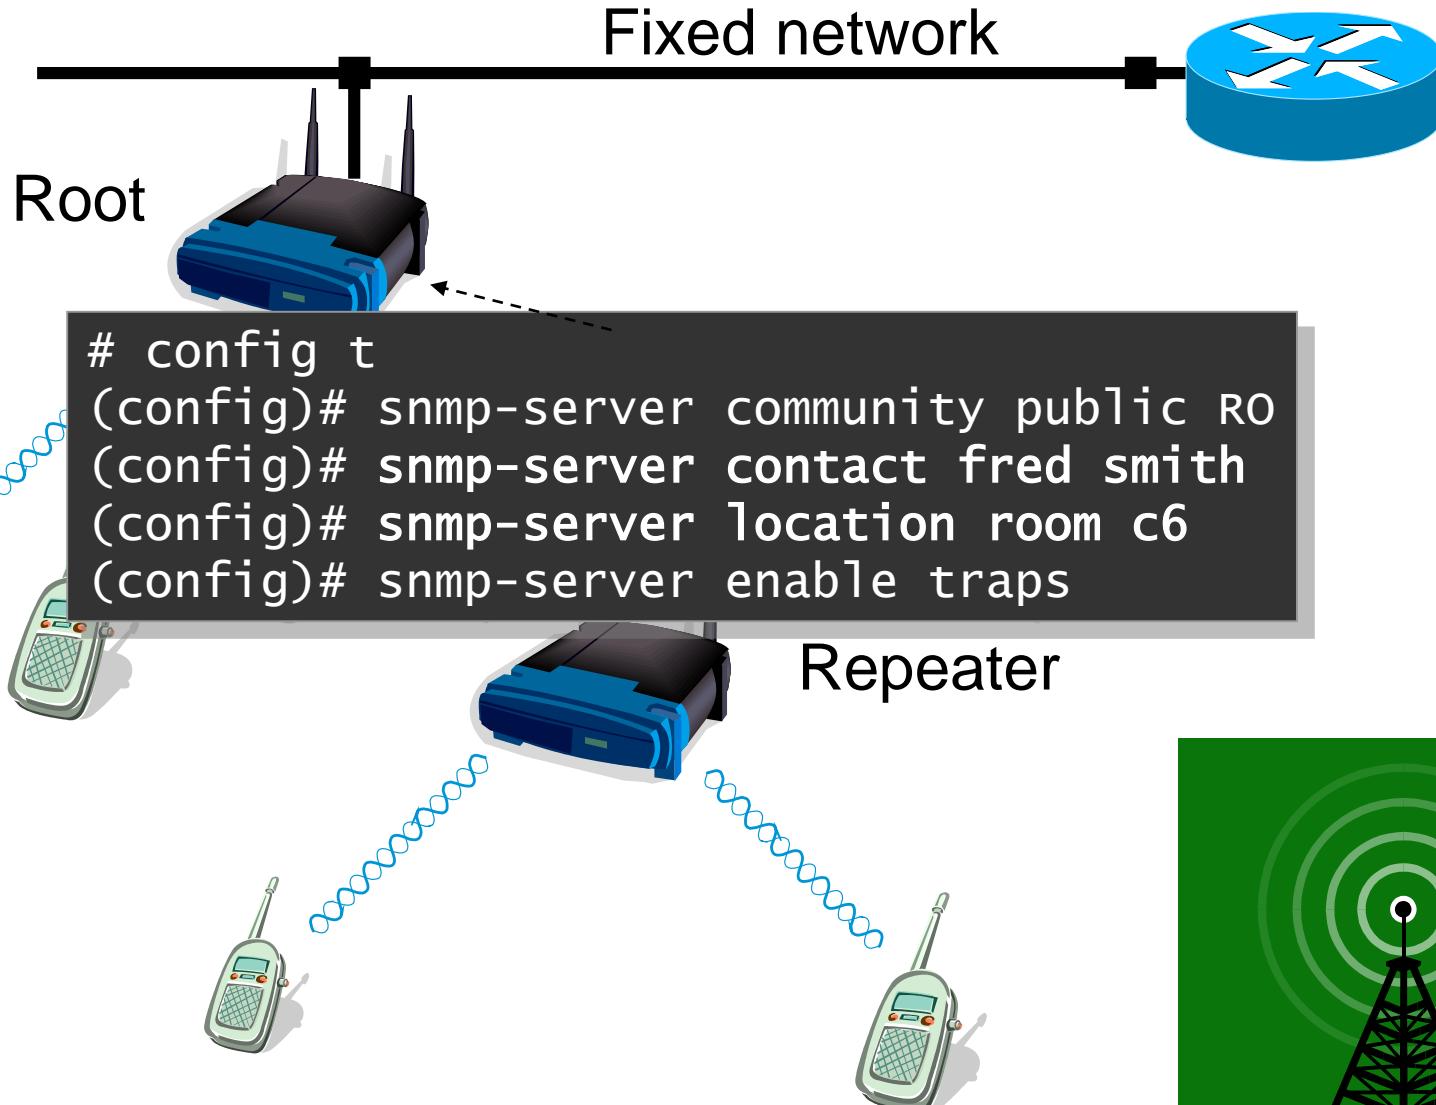

- ifNumber. Number of interfaces.
- ifTable. List of interface entities:
 - ifIndex. Interface index value.
 - ifDescr. Interface description.
 - ifType. Interface type: other(1), regular1822(2), hdh1822(3), ddn-x25(4), rfc877-x25(5), ethernet-csmacd(6), iso88023-csmacd(7), iso88024-tokenBus(8), iso88025-tokenRing(9), iso88026-man(10), starLan(11), proteon-10Mbit(12), proteon-80Mbit(13), hyperchannel(14), fddi(15), lapb(16), sdlc(17), ds1(18), e1(19), basicISDN(20), primaryISDN(21), ppp(23), softwareLoopback(24), eon(25), ethernet-3Mbit(26))
 - ifSpeed. Speed of interface, in bits per second.
 - ifPhysAddress.
 - ifAdminStatus. Administration status is Up (1), down (2) or testing (3).
 - ifOperStatus. Operational status is Up (1), down (2) or testing (3).
 - ifLastChange. Time since last change.
 - ifInUcastPkts.
 - ifInNUcastPkts.
 - ifInDiscards.
 - ifInErrors.
 - ...
 - ifOutErrors.
 - ifOutQLen.
 - ifSpecific.

- ipForwarding. Defines whether the node is a gateway or not. It can be set to: forwarding (for a gateway) or not-forwarding.
- ipDefaultTTL. IP Time-to-live.
- ipInReceives. The total number of IP packets (including ones in error).
- ipInHdrErrors. Discarded IP packets, due to header problems.
- ipInAddrErrors . Discarded IP packets, due to incorrect addresses (such as 0.0.0.0).
- ipForwDatagrams. Number of IP packets which were forwarded.
- ipInUnknownProtos. Number of IP packets with an unknown protocol.
- ipInDiscards. Discarded packets due to processing problems, such as lack of buffer memory.
- ipInDelivers. Number of successfully IP packets.
- ipOutRequests.
- ipOutDiscards.
- ipOutNoRoutes. Discarded IP packets, due to no router for the packets.
- ipFragOKs. Number of completed fragments.
- ipFragFails. Number of unsuccessful fragments.
- ipFragCreates. Number of fragments created.
- ipAddrTable.
- ipAddrEntry:
 - ipAdEntAddr. Network address.
 - ipAdEntIfIndex. Address index.
 - ipAdEntNetMask. Subnet mask.
 - ipAdEntBcastAddr. Broadcast address.
 - ipAdEntReasmMaxSize.
- ipRoutingTable:
 - ipRouteDest. Destination address. A value of 0.0.0.0 is defined as a default route.
 - ipRouteIfIndex Route index.
 - ipRouteMetric1. Route metric 1. If it is not using the value is set to -1.
 - ...

MIB name	Description	OID
• sysName	Hostname	.1.3.6.1.2.1.1.5.0
• sysUpTime	Uptime	.1.3.6.1.2.1.1.3.0
• sysDescr	System Description	.1.3.6.1.2.1.1.1.0
• sysContact	System Contact	.1.3.6.1.2.1.1.4.0
• sysLocation	System Location	.1.3.6.1.2.1.1.6.0
• ciscoImageString.5	IOS Version	.1.3.6.1.4.1.9.9.25.1.1.1.2.5
• avgBusy1	1-Minute CPU Util.	.1.3.6.1.4.1.9.2.1.57.0
• avgBusy5	5-Minute CPU Util.	.1.3.6.1.4.1.9.2.1.58.0
• freeMem	Free memory	.1.3.6.1.4.1.9.2.1.8.0
• ciscoImageString.4	IOS feature set	.1.3.6.1.4.1.9.9.25.1.1.1.2.4

Keyword	Description
• internet	Entire MIB tree
• mib-2	Entire MIB-II tree
• system	System branch of the MIB-II tree
• interfaces	Interface branch of the MIB-II tree
• at	ARP table branch of the MIB-II tree
• ip	IP routing table branch of the MIB-II tree
• icmp	ICMP statistics branch of the MIB-II tree
• tcp	TCP statistics branch of the MIB-II tree
• udp	UDP statistics branch of the MIB-II tree
• transmission	Transmission statistics of the MIB-II tree
• snmp	SNMP statistics branch of the MIB-II tree
• ospf	OSPF MIB
• bgp	BGP MIB
• rmon	RMON MIB
• cisco	Cisco's enterprise MIB tree
• x25	X.25 MIB
• ifEntry	Interface statistics MIB objects
• lsystem	Cisco's system MIB

<u>Keyword</u>	<u>Description</u>
• bgp	Allow BGP state change traps
• bstun	Allow bstun event traps
• config	Allow SNMP configuration traps
• dlsw	Allow DLSw traps
• dsp	Allow SNMP DSP traps
• dsru	Allow dsru event traps
• entity	Allow SNMP entity traps
• envmon	Allow environmental monitor traps
• frame-relay	Allow SNMP Frame Relay traps
• hsrp	Allow SNMP HSRP traps
• ipmulticast	Allow SNMP IP multicast traps
• isdn	Allow SNMP ISDN trap
• msdp	Allow SNMP MSDP traps
• rsrb	Allow rsrb event traps
• rsvp	Allow RSVP flow change traps
• rtr	Allow SNMP Response Time Reporter (RTR) traps
• sdlc	Allow SDLC event traps
• sdllc	Allow SDLLC event traps
• snmp	Allow SNMP-type notifications
• stun	Allow stun event traps
