## Wireless connections ... which technology?

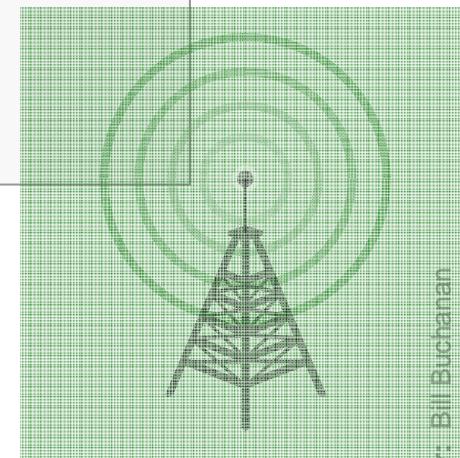

### Areas covered:

**VLANs**

**IEEE 802.1q**

**GSM/3G**

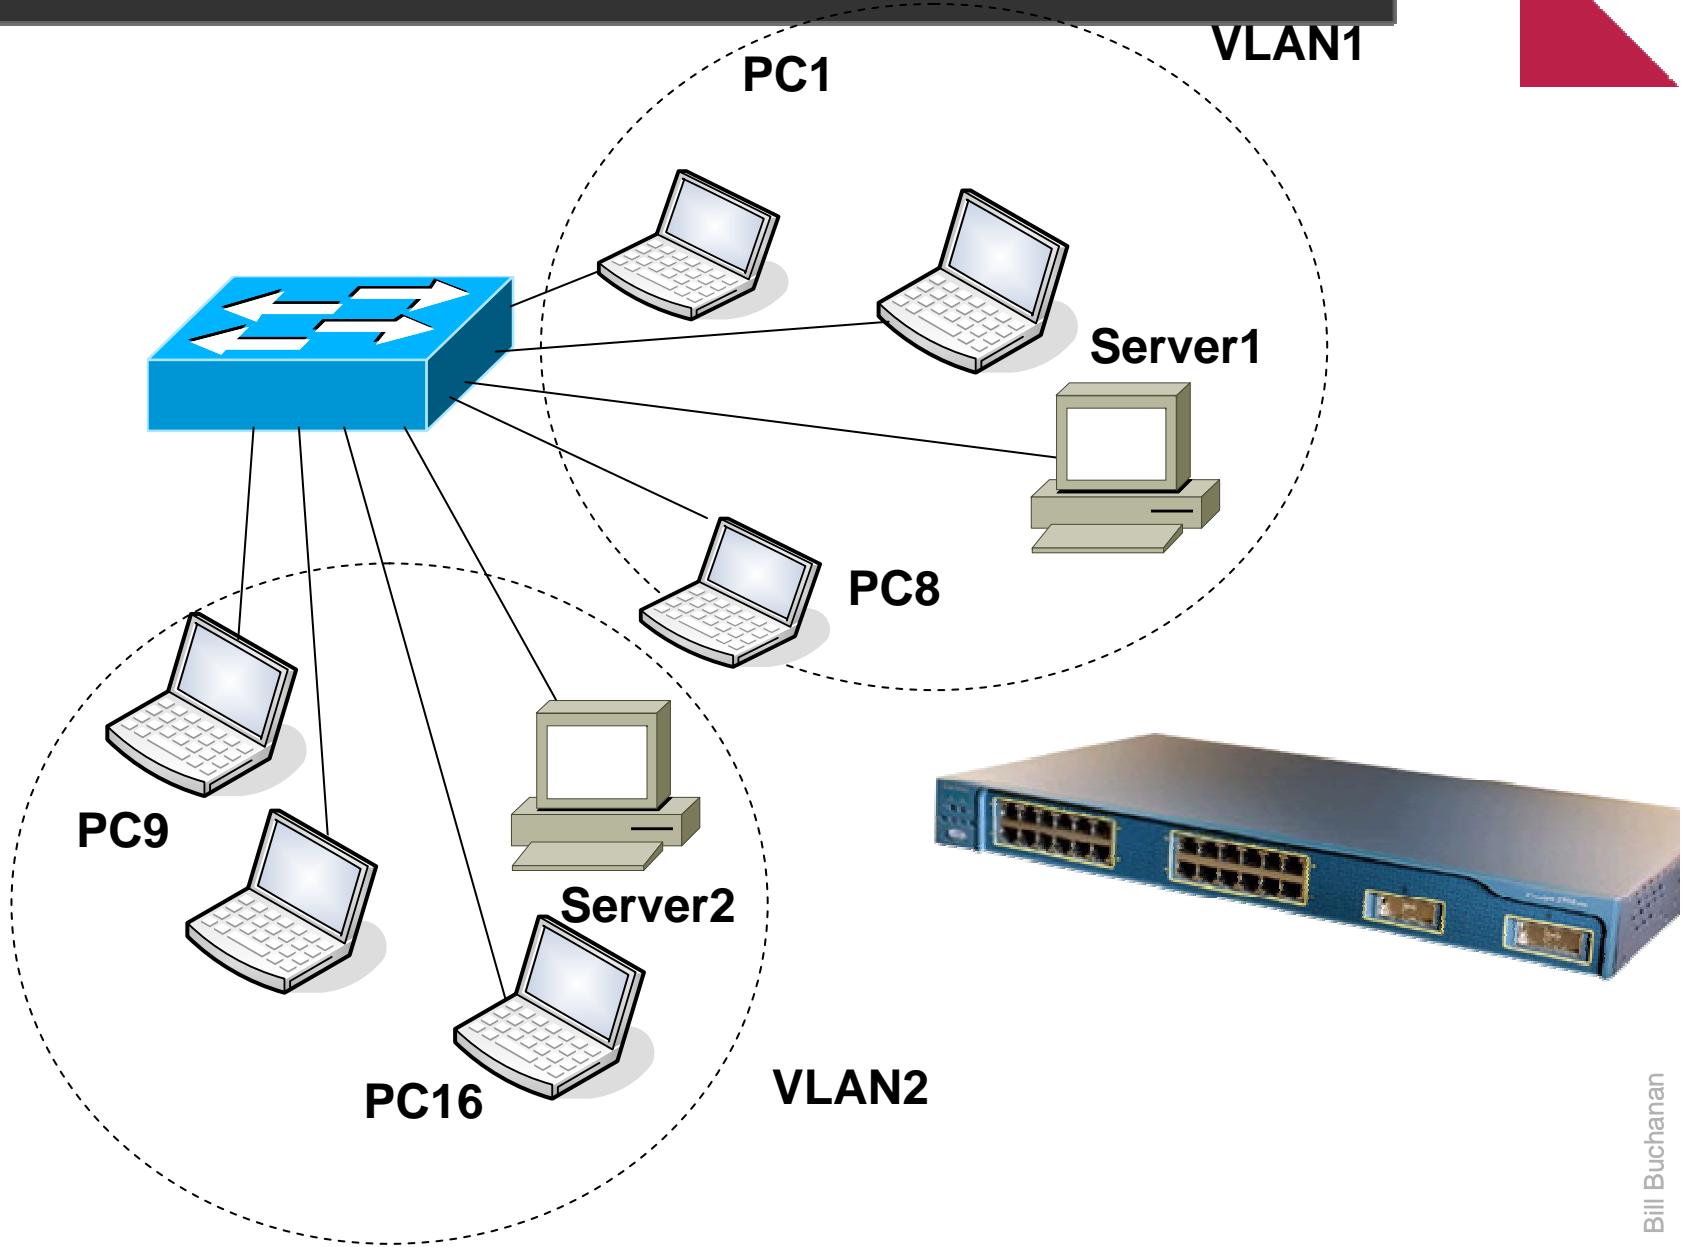

Author: Bill Buchanan

# Virtual LANs

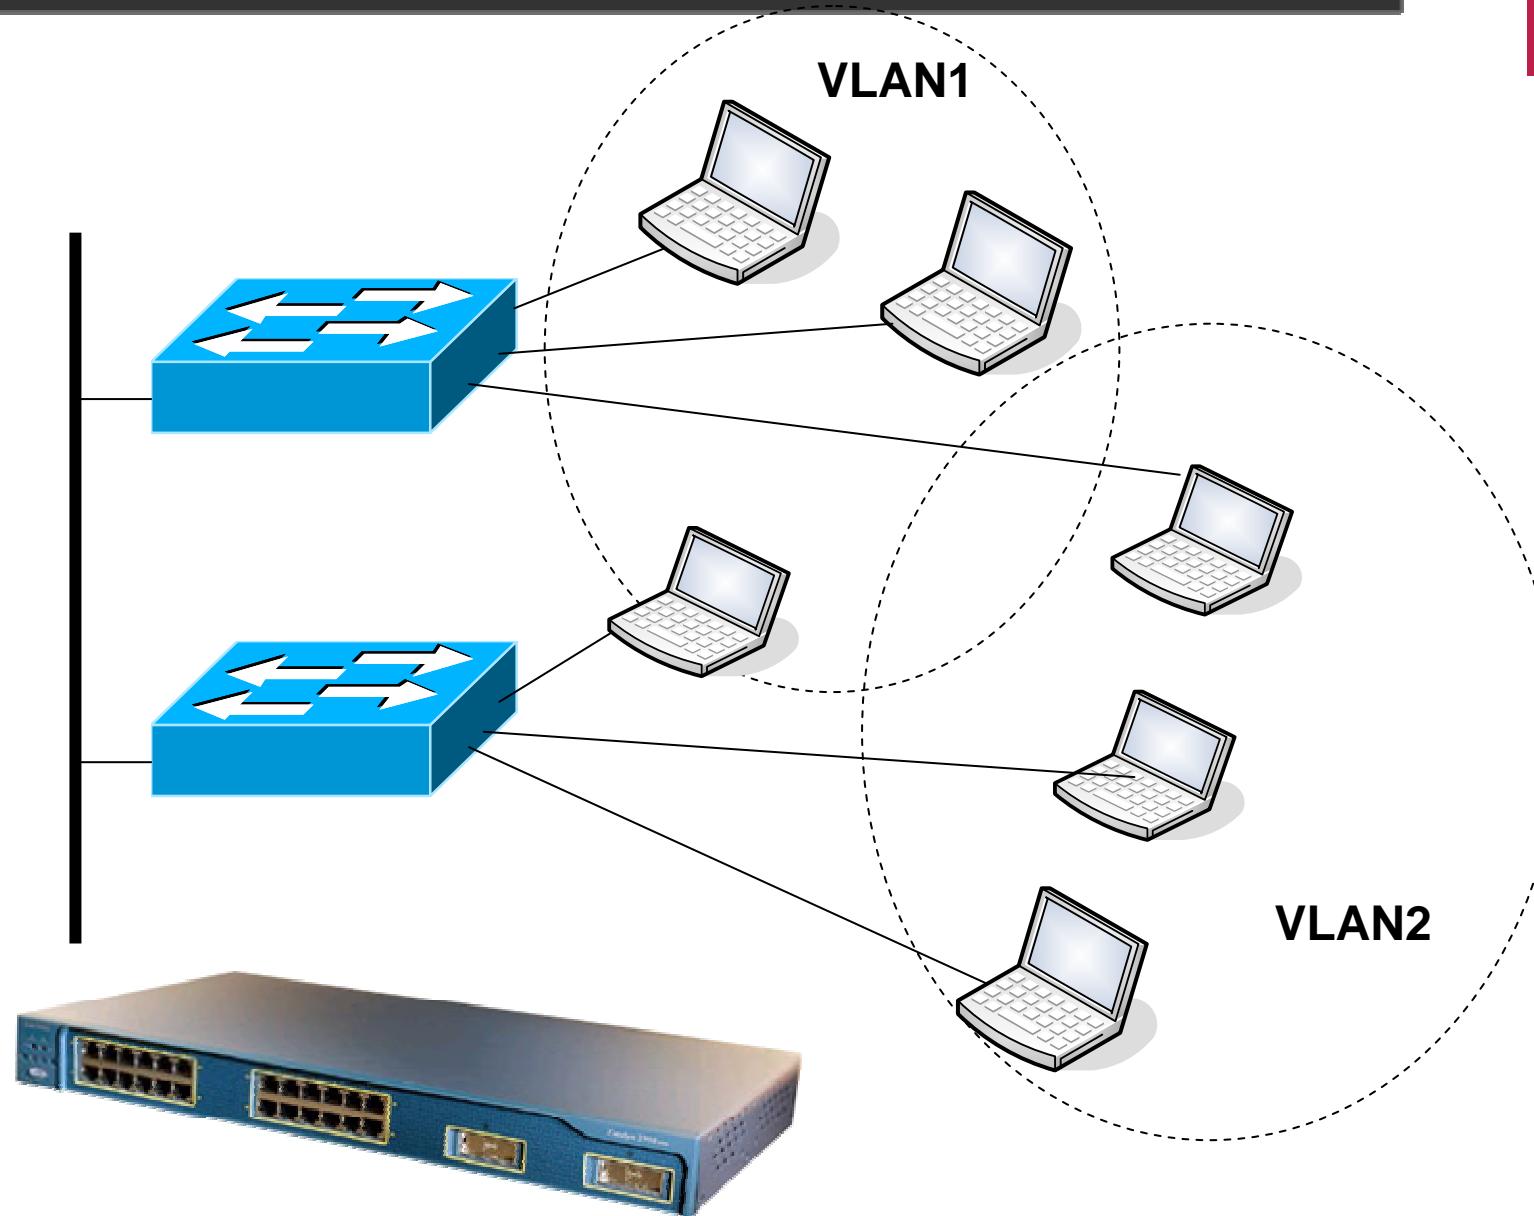

# Wireless LAN - CO72047

Prof W Buchanan - Centre  
for Dist. Computing and Security

# Wireless LAN - CO72047

Prof W Buchanan - Centre  
for Dist. Computing and Security

## Why VLANs?

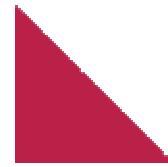

**Creation of virtual networks.** Just as many organizations build open-plan offices which can be changed when required, VLANs can be used to reconfigure the logical connections to a network without actually having to physically move any of the resources.

**Ease of administration.** VLANs allow networks to be easily configured, possibly at a distance from the configured networks. In the past reconfiguration has meant recabling and the movement of networked resources.

**Improved bandwidth usage.** Normally users who work in a similar area share resources. This is typically known as a workgroup. If workgroups can be isolated from other workgroups then traffic which stays within each of the workgroups does not affect other workgroups. A VLAN utilizes this concept by grouping users who share information and configuring the networked resources around them.

## Why VLANs?

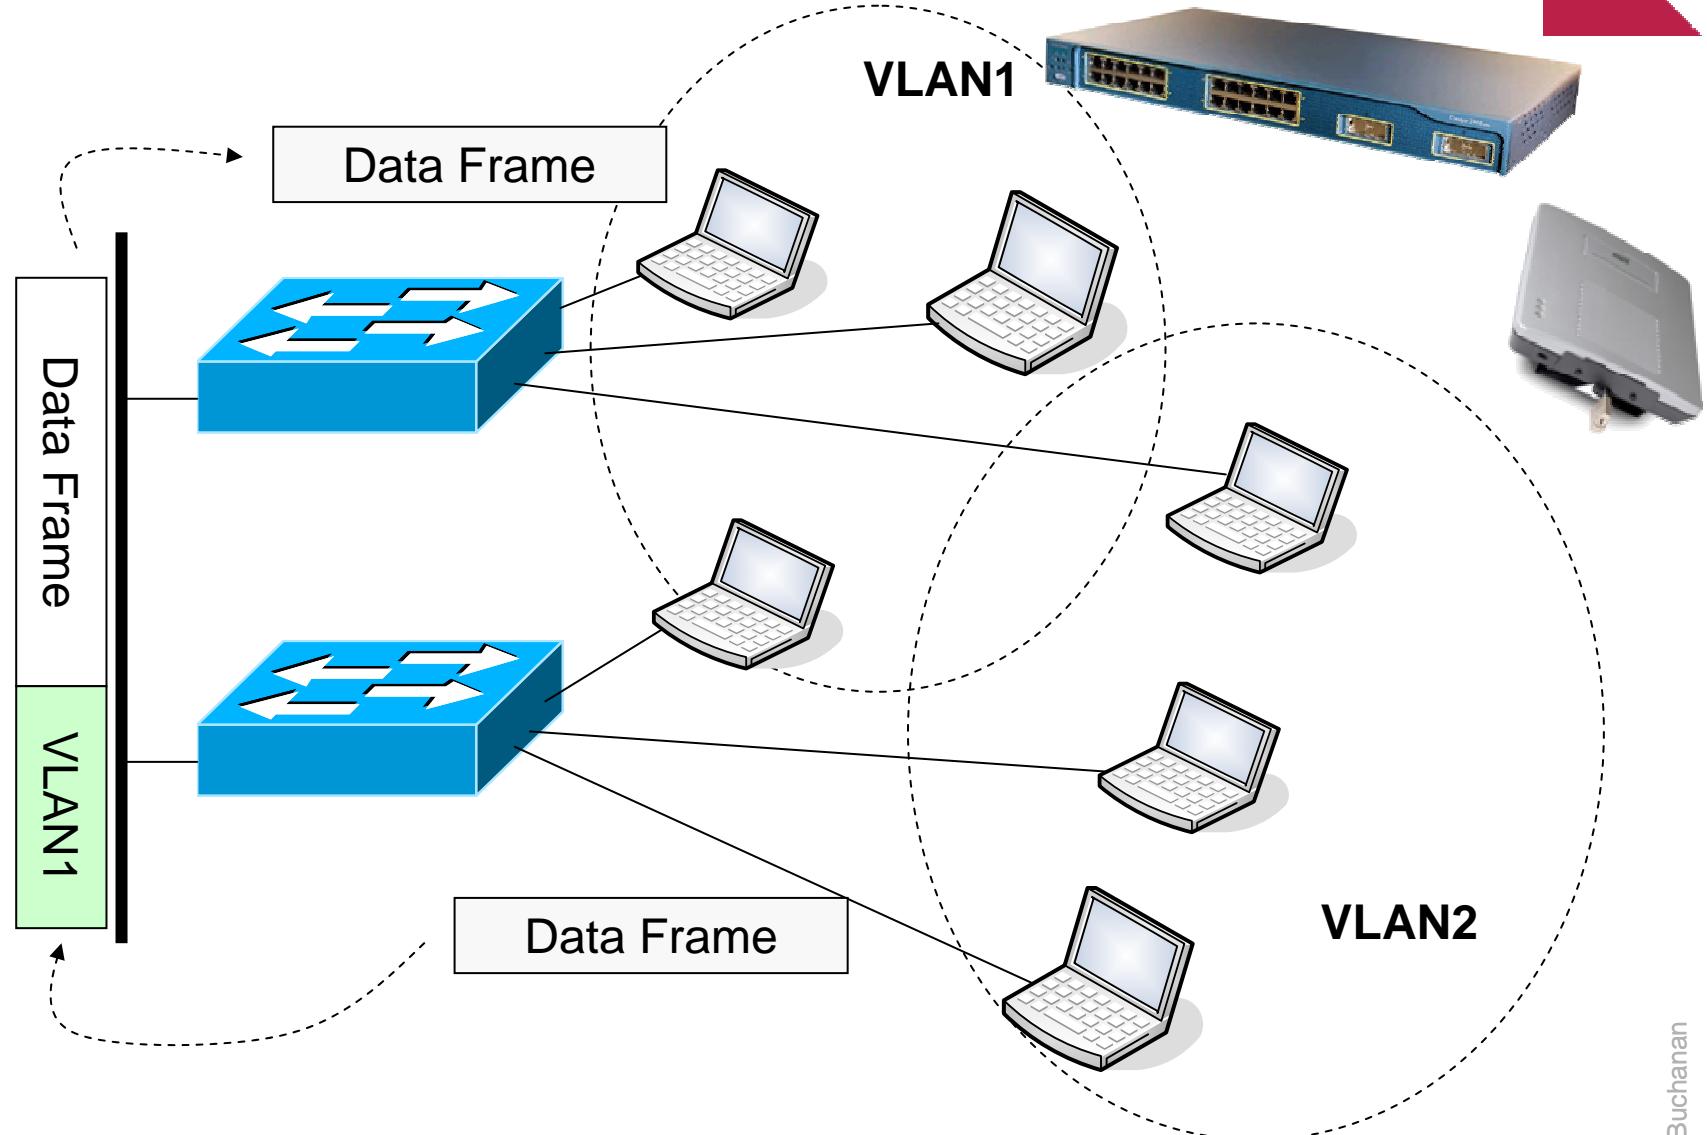

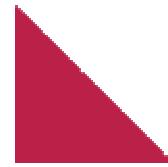

**Microsegmentation.** This involves dividing a network into smaller segments, which will increase the overall bandwidth available to networked devices.

**Enhanced security.** VLANs help to isolate network traffic so that traffic which stays within a VLAN will not be transmitted outside it. Thus it is difficult for an external user to 'listen' to any of the data that is transmitted across the VLAN, unless they can get access to one of the ports of the VLAN device.

**Relocate servers into secured locations.** VLANs allow for servers to be put in a physical location in which they cannot be tampered with. This will typically be in a secure room, which is under lock and key. The VLAN can be used to map hosts to servers.

**Easy creation of IP subnets.** VLANs allow the creation of IP subnets, which are not dependent on the physical location of a node. Users can also remain part of a subnet, even if they move their computer.

## IEEE 802.1q

# Ethernet Data frame

## Ethernet II

Preamble	Dst MAC (6 bytes)	Src MAC (6 bytes)	Ethertype (2 bytes)	Data (46-1500)	FCS (4 bytes)

## Ethernet II

↔

**16-bit**

**IEEE 802.1Q**

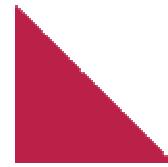

**Static vLANs.** These are ports on a switch that are statically assigned to a VLAN. These remain permanently assigned, until they are changed by the administrator. Static vLANs are secure and easy to configure, and are useful where vLANs are fairly well defined.

**Dynamic VLANs.** These are ports on a switch which automatically determine their VLAN assignments. This is achieved with intelligent management software, using MAC addresses, logical addressing, or the protocol type of the data packets. Initially, where a node connects to the switch, the switch detects its MAC address entry in the VLAN management database and dynamically configures the port with the corresponding VLAN configuration. The advantage of dynamic vLANs is that they require less setup from the administrator (but the database must be initially created).

## VLAN types

**Port-Based VLAN.** Port defines the VLAN.

**MAC-based VLAN.** MAC addresses define the membership.

**Protocol-based VLAN.** Defined by Layer 3 protocol, such as for IP or IPX.

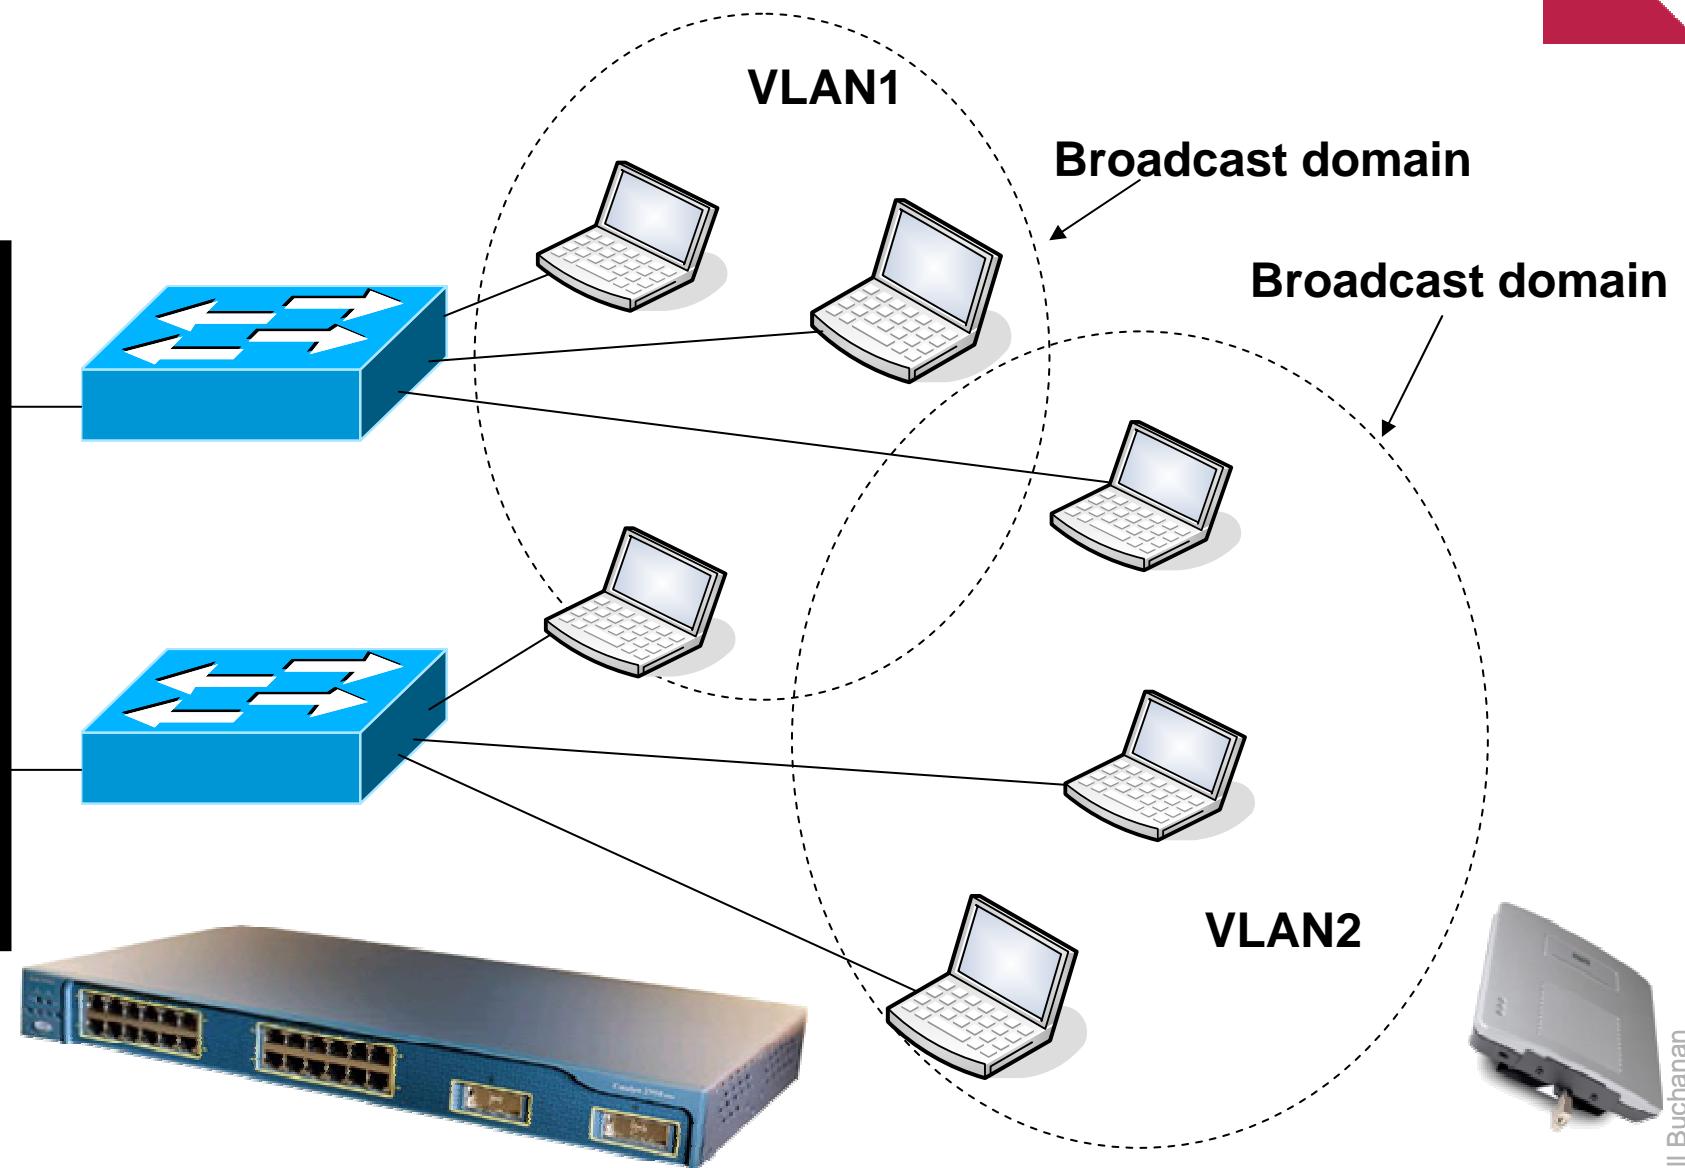

**SSID-based.** This defines that certain nodes which authenticate to a certain SSID are part of a VLAN.

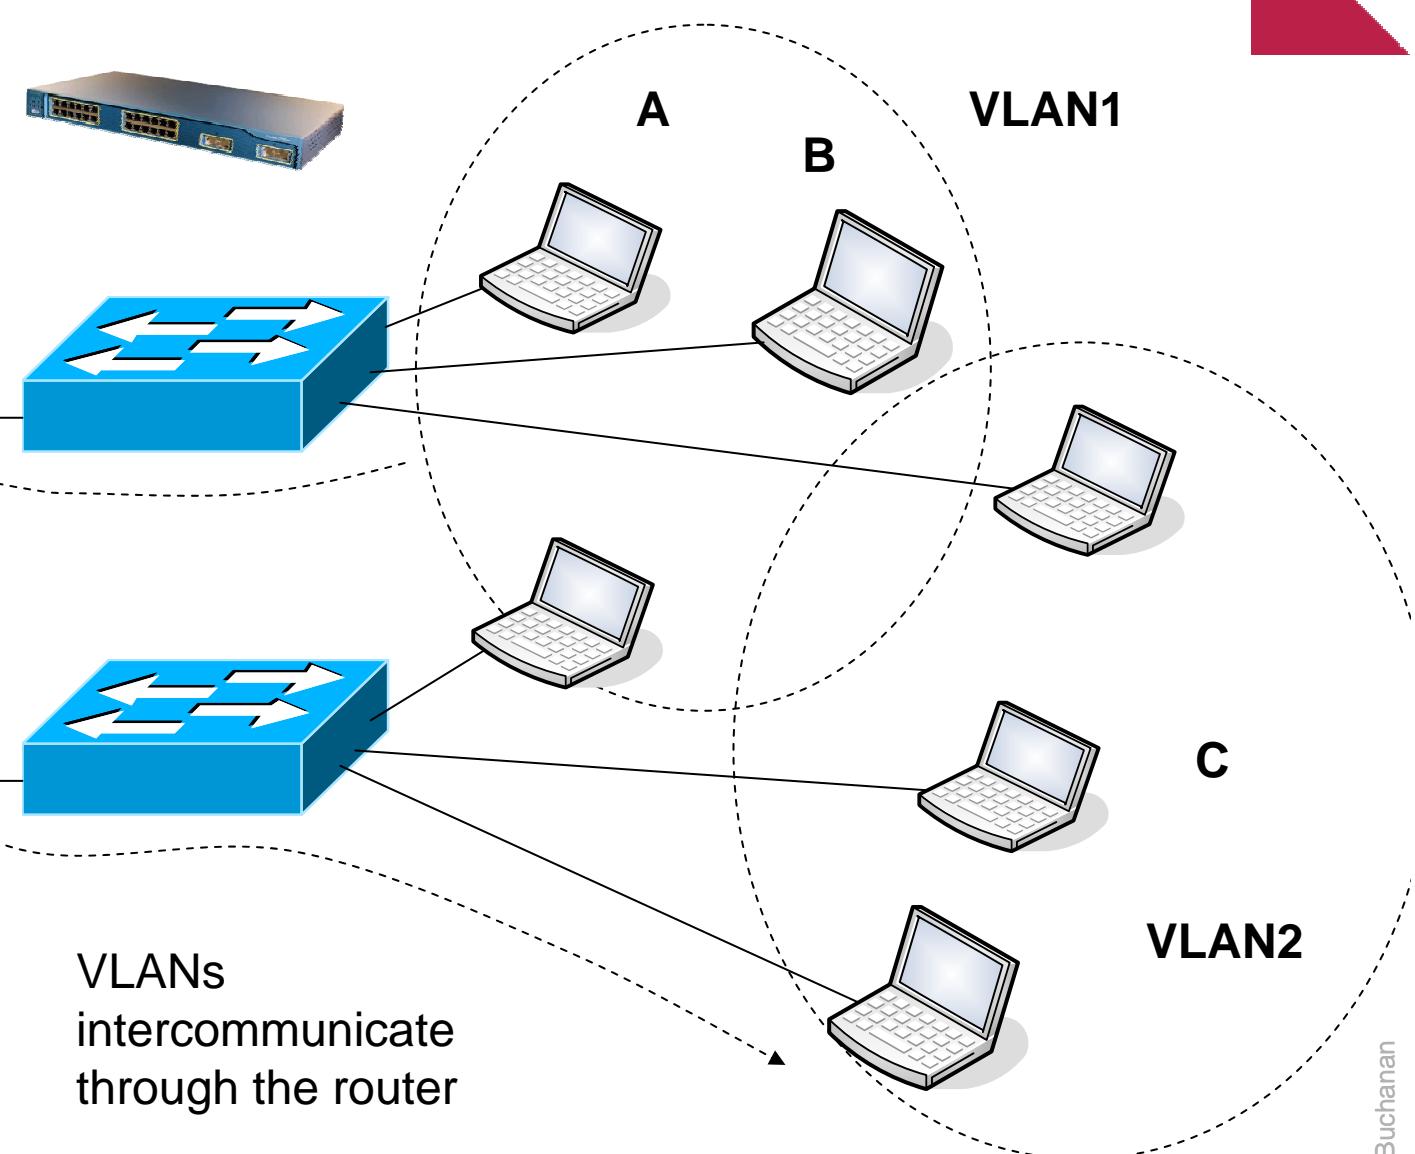

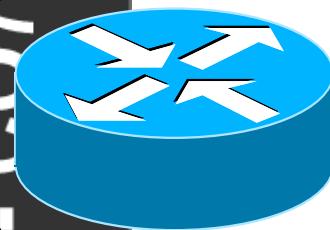

**ATM VLAN.** This maps Ethernet packets into ATM cells.
